### Beaks of Finches State Lab

<https://www.youtube.com/watch?v=8ZkrAAGFQ-M>

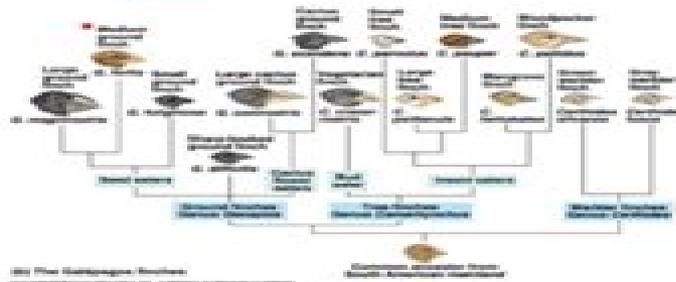

#### Background Information for lab:

Charles Darwin first started to piece together his theory on *natural selection* while on a scientific expedition to the *Galapagos Islands*. The Galapagos Islands are located on the equator in the **Pacific** Ocean.

What is a *habitat*? **An organisms Home**

What is a *niche*? **Job or role (what it eats or what it gets eaten by)**

Darwin noticed that the birds had different *physical characteristics*. Specifically, their **beaks** were very varied in **size** and **shape**!

Darwin believed that the different beaks were a result of the slightly different environments of on each island. The *availability of food* and *type of vegetation* varied slightly from one island to the next.

He determined that the **natural** environment is responsible for *selecting* the individuals with the most **favorable** trait.

The variations that exist in a population are a result of **sexual** reproduction and **random mutations**, but the environment determines if the variety will be **advantageous** or not.

The *variation* in beaks allows many finches to all **coexist** on one island together. To **coexist** means to live together in one location without **competition for food**.

If there was *limited variation* in the beaks of finches, then they would **compete**. This is because they would most likely feed on the **same** source of food. They would share a **niche**. Animals that share a **niche** will compete until there is only one species per niche. Competition for food increases when resources are limited.
