*Multivariate Statistics: Wolfgang Karl Härdle, Zdenek Hlavka, 2007-07-05* There can be no question my dear Watson of the value of exercise before breakfast Sherlock Holmes in The Adventure of Black Peter The statistical analysis of multivariate data requires a variety of techniques that are entirely different from the analysis of one dimensional data The study of the joint distribution of many variables in high dimensions involves matrix techniques that are not part of standard curricula The same is true for transformations and computer intensive techniques such as projection pursuit The purpose of this book is to provide a set of exercises and solutions to help the student become familiar with the techniques necessary to analyze high dimensional data It is our belief that learning to apply multivariate statistics is like studying the elements of a criminological case To become proficient students must not simply follow a standardized procedure they must compose with creativity the parts of the puzzle in order to see the big picture We therefore refer to Sherlock Holmes and Dr Watson citations as typical descriptors of the analysis Puerile as such an exercise may seem it sharpens the faculties of observation and teaches one where to look and what to look for

**The Subjectivity of Scientists and the Bayesian Approach** S. James Press, Judith M. Tanur, 2012-01-20 Comparing and contrasting the reality of subjectivity in the work of history's great scientists and the modern Bayesian approach to statistical analysis Scientists and researchers are taught to analyze their data from an objective point of view allowing the data to speak for themselves rather than assigning them meaning based on expectations or opinions But scientists have never behaved fully objectively Throughout history some of our greatest scientific minds have relied on intuition hunches and personal beliefs to make sense of empirical data and these subjective influences have often aided in humanity's greatest scientific achievements The authors argue that subjectivity has not only played a significant role in the advancement of science but that science will advance more rapidly if the modern methods of Bayesian statistical analysis replace some of the classical twentieth century methods that have traditionally been taught To accomplish this goal the authors examine the lives and work of history's great scientists and show that even the most successful have sometimes misrepresented findings or been influenced by their own preconceived notions of religion

metaphysics and the occult or the personal beliefs of their mentors. Contrary to popular belief, our greatest scientific thinkers approached their data with a combination of subjectivity and empiricism and thus informally achieved what is more formally accomplished by the modern Bayesian approach to data analysis. Yet we are still taught that science is purely objective. This innovative book dispels that myth using historical accounts and biographical sketches of more than a dozen great scientists including Aristotle, Galileo Galilei, Johannes Kepler, William Harvey, Sir Isaac Newton, Antoine Lavoisier, Alexander von Humboldt, Michael Faraday, Charles Darwin, Louis Pasteur, Gregor Mendel, Sigmund Freud, Marie Curie, Robert Millikan, Albert Einstein, Sir Cyril Burt, and Margaret Mead. Also included is a detailed treatment of the modern Bayesian approach to data analysis. Up-to-date references to the Bayesian theoretical and applied literature as well as reference lists of the primary sources of the principal works of all the scientists discussed round out this comprehensive treatment of the subject. Readers will benefit from this cogent and enlightening view of the history of subjectivity in science and the author's alternative vision of how the Bayesian approach should be used to further the cause of science and learning well into the twenty-first century.
