

## 2.5 Exploring Graphs of Rational Functions

The restricted values of rational functions correspond to two different types of graphical features: **holes** and **vertical asymptotes**. A hole is a point on the graph where the graph appears continuous but at one  $x$  value will be undefined and therefore creates a hole at that location. An asymptote is an imaginary line that a graph gets closer and closer to but never touches as the graph continues to infinite or negative infinite.

### Holes:

A Hole will occur at restricted values that result from a factor of the denominator that is a factor of numerator (factors that will be divided out).

$$g(x) = \frac{x^2 - x - 2}{(x - 2)}$$

Has a hole at  $x = 2$ , since  $g(x)$  can be factored to the rational equation:

$$g(x) = \frac{(x - 2)(x + 1)}{(x - 2)} ; x \neq 2$$

$$g(x) = x + 1$$

### Vertical Asymptotes:

A vertical asymptote occurs at a restricted value that is still a zero of the denominator after simplification.

$$g(x) = \frac{3}{x - 5} ; x \neq 5$$

In this example there would be a vertical asymptote at  $x = 5$ .

Remember that the graph of the reciprocal function  $y = \frac{1}{x}$  is shown below. It has a vertical asymptote at  $x = 0$  and a horizontal asymptote at  $y = 0$ .

Noncommutative Rational Functions and Their Finite-dimensional Representations Jurij Volčič, 2017 Noncommutative rational functions form a free skew field a universal object in the category of skew fields They emerge in various branches of pure and applied mathematics such as noncommutative algebra automata theory control theory free analysis free real algebraic geometry and free probability A noncommutative rational function is given by a formal rational expression involving freely noncommuting variables and arithmetic operations which can be naturally evaluated at tuples of matrices of all sizes This dissertation studies such finite dimensional evaluations with the goal of determining what information about the structure of the free skew field can be recovered from them Firstly a matrix coefficient realization theory is developed which for an arbitrary noncommutative rational function yields an efficiently computable normal form Such a realization of a noncommutative rational function measures its complexity and describes its natural domain as the complement of a free singularity locus of a linear matrix pencil The inclusion problem for free loci and thus for domains of noncommutative rational functions is next solved in terms of epimorphisms between the coefficient algebras of the corresponding linear matrix pencils This theorem called a Singularitätstellensatz for linear matrix pencils is closely related to the invariant theory of the general linear group Via realization theory this result yields an algebraic characterization of noncommutative rational

functions with a given domain. Moreover, a description of noncommutative rational functions whose domains contain all tuples of hermitian matrices is derived. In particular, it is proven that an everywhere defined noncommutative rational function is a noncommutative polynomial. The understanding of the behavior of noncommutative rational functions under hermitian evaluations is further advanced by the resolution of a noncommutative analog of Hilbert's 17th problem: a noncommutative rational function that is positive semidefinite at every tuple of hermitian matrices is a sum of hermitian squares of noncommutative rational functions. Finally, the construction of the free skew field via matrix evaluations is extended to partially commuting arguments. The obtained multipartite rational functions play a remarkable role in the theory of universal skew fields of fractions and in the difference differential calculus in free analysis.
