Javascript

- Javascript is a high-level, dynamic, interpreted language widely used to create interactive content. Alongside HTML and CSS, it is one of the three core technologies of the World Wide Web.
- Brendan Eich created Javascript in 1995 at Netscape Communications. It was originally named "LiveScript", and finally "JavaScript".

Key Features

Client-Side Language: Primarily used to add interactivity and provide dynamic functionality to web pages.

Event-Driven: Javascript can respond to user actions, such as clicks, mouseovers, and keyboard input, allowing for interactive web pages.

Prototype-Based: Javascript uses prototype-based inheritance, allowing objects to inherit properties and methods from other objects, providing a flexible and dynamic approach to class-like structures.

Weakly Typed: Javascript is a weakly typed language, meaning variables can hold values of different data types without explicit declaration.

Asynchronous Programming: Javascript can execute tasks in parallel through mechanisms like callbacks, promises, and async/await, making it efficient for handling long-running operations without blocking the main execution thread.
