Java Source Code Text Mining:

Text Analysis Pipelines Henning Wachsmuth,2015-12-02 This monograph proposes a comprehensive and fully automatic approach to designing text analysis pipelines for arbitrary information needs that are optimal in terms of run time efficiency and that robustly mine relevant information from text of any kind Based on state of the art techniques from machine learning and other areas of artificial intelligence novel pipeline construction and execution algorithms are developed and implemented in prototypical software Formal analyses of the algorithms and extensive empirical experiments underline that the proposed approach represents an essential step towards the ad hoc use of text mining in web search and big data analytics Both web search and big data analytics aim to fulfill peoples needs for information in an adhoc manner The information sought for is often hidden in large amounts of natural language text Instead of simply returning links to potentially relevant texts leading search and analytics engines have started to directly mine relevant information from the texts To this end they execute text analysis pipelines that may consist of several complex information extraction and text classification stages Due to practical requirements of efficiency and robustness however the use of text mining has so far been limited to anticipated information needs that can be fulfilled with rather simple manually constructed pipelines

topic of this thesis is to develop a graph based static analysis framework for Java code that tolerates incomplete or non compiling source code For this purpose the concept of Code Property Graphs CPGs is to be researched and extended in order to provide information about more complex erroneous patterns in Java source code Additionally an evaluation of the resulting graph model is to be performed by searching for cryptographic vulnerabilities in publicly available Java projects This evaluation needs to show whether this graph based analysis approach is capable of finding security issues in Java code and how feasible the analysis is from a performance point of view Automatic code analysis is a widely used technique to find and eliminate errors in software projects Instead of executing the program and verify that its behavior is correct as dynamic analysis does it static analysis is applied on its source code Here we search for suspicious patterns that are likely to indicate erroneous behavior A special type of software bugs are those errors that lead to security vulnerabilities In this case attackers may be able to undermine fundamental security aspects by exfiltrating sensitive user data from server applications or assume control over the machine running the program in question Security vulnerabilities in the code can have drastic consequences which is why it is important to identify them as fast as possible and fix them immediately afterwards This thesis extends the concept of Code Property Graphs CPGs which has been proposed for static analysis of C C code to be applied on programs and incomplete code snippets written in Java Unifying Abstract Syntax Trees ASTs Control Flow Graphs CFGs and Data Flow Graphs DFGs in a single datastructure this approach enables searching for vulnerabilities whose code patterns are spread out across the boundaries of single methods and classes These patterns are identified using the graph query language cypher which is provided by the graph database Neo4j In an evaluation run on 100 public repositories on GitHub using cryptography 135 findings of cryptographic API misuse have been identified using this technique These include the use of insecure algorithms like the Data Encryption Standard DES or Electronic Code Book mode ECB and hardcoded passwords that are used for encryption purposes This thesis has been created in cooperation with Fraunhofer AISEC
