

Pinguicula caerulea Walter
Butterwort

Walter, T., 1788, *Fl. Carol.* 63.

The species name is derived from the Latin *caeruleus* (azure blue), a reference to the color of the flowers. The common name violet butterwort would indicate, by analogy, that it has a distribution that occupies an arc along the Atlantic coastal plain from southern Florida, and west as far as Appalachian National Forest. It grows in recently damp areas away from standing water. Though it often occurs with other species, it appears to intermingle or even form abutting colonies at the same sites.

This perennial species forms flattened rosettes of green leaves 5-10 cm in diameter, usually involute, giving the semblance of sharp leaf tips (Figure 80). Flowering stems are glandular scapes up to 25 cm tall that may be slightly hairy close to the base. The flowers are a shade of violet, with prominent violet venation (Figures 79, 80, 81 and 84). The taste, which is usually creamy white, is prominently covered. Flowering stems of exceptional specimens with entirely white flowers have been documented.

In the majority of plants produce flowers of pale violet with prominent venation. The flowers are so violet so deep that the venation is no longer apparent. In some cases, plants producing entirely white flowers have also been documented. The form *P. caerulea*, producing populations with intermediate coloration. It is distinguishable from *P. fuzesi* when not in flower, the only reliable means of distinguishing them is by comparing flowering plants. The white-flowered form of *P. caerulea* is therefore, is by comparing flowering plants. The white-flowered form of *P. caerulea* is much smaller than white-flowered plants of *P. pusilla* by their larger size, as the same plant species is much smaller.
