### Multiple Choice Question

- Which of these does not occur during the descent of the testes?
  - Each gubernaculum elongates as development continues, and the testes are held in position.
  - Small peritoneal cavity pockets develop as the testes change positions.
  - The seventh developmental month is characterized by fast growth and hormone-induced contraction of the gubernaculum testis muscles.
  - None of the above.
  - In the direction of the anterior abdominal wall, the testes progressively advance inferiorly and anteriorly.
- What is the reason a prostate exam is done through the rectum?
  - The Prostate is located close to the rectum.
  - The peripheral zone is located at the posterior of the gland, where most cancers occur.
  - It is beneath the rest of the male reproductive glands, making it easier to be felt through the rectum.
  - The acini sacs of the prostate would push on the rectum.
- Penile cancer can metastasize throughout the simple squamous cells of the superficial skin layer of the penis. It is often caused by infected cells mostly found at the head region of the penis near the glans. Using your knowledge about the anatomy of the penis, which course of action would *most likely* be taken to decrease the risk of spread?
  - Since penile cancer starts at the urethra, treating this region with antibiotics would most efficiently decrease the spread.
  - Since penile cancer starts spreading throughout the body (shaft) of the penis, treating this region with antibiotics would decrease the spread.
  - Since penile cancer originates at the foreskin of the penis, circumcision or removal of this layer could decrease the spread.
  - Since penile cancer originates in the inner erectile/elastic tissue, radiation to remove these cancerous cells could decrease the spread.
- Which of the following will *not* result in sperm immaturity?
  - Inhibin is underproduced by nurse cells.
  - All the possible choices are correct.
