

Carbon Arrow Selection Guide

Chapter 1 Basics and Measurements

Intro: Arrows Make a Big Difference!

To bowhunters who select their arrows each season by grabbing a handful from the miscellaneous arrow bucket at the local super-mart, you may be surprised to learn that shooting custom arrows will greatly improve your success in the field - for less money than you might think. If you want reliable and accurate performance from your compound bow, shooting the proper arrow is very important. All arrows are not created equal. An arrow should be built to match the specific settings and output characteristics of YOUR bow setup, so every shot launches perfectly from your bow without fishtailing or porpoising. An improper arrow will not only fly poorly, profoundly degrading your accuracy, but it may present a safety hazard for you and your expensive compound bow. There are a number of important considerations to juggle: proper spine, FOC balance, weight, straightness, fletching material, fletching angle, arrow length, etc., when selecting a set of hunting or 3D arrows. And if you're feeling a bit lost, don't worry. This isn't exactly rocket-science - just a bit of background information you'll need to know in order to make an informed choice. These next sections will take you step-by-step through the process of selecting and ordering arrows with just the right specifications to match your particular bow system. We hope you find this help section useful.

Let start with the basics. The parts of a modern hunting arrow are pretty straight forward, but these parts will be referred to throughout this help guide. So before we really get going here, let's take a moment to bone-up on our arrow jargon.

The foundation of every arrow is the SHAFT, a long hollow tube usually made of aluminium or carbon/graphite composite materials. The rear of the arrow is fitted with a small piece of molded plastic called a NOCK, which allows the arrow to physically attach to the bow's string. At the front of the arrow is a small aluminium (sometimes plastic) sleeve called an INSERT. The insert gets glued into the end of the shaft and provides a threaded hole in which to screw in the arrow's TIP. A tip doesn't necessarily have to be a practice point (as pictured here). A standard insert allows you to screw-in and use of a variety of tips in the same arrow (broadheads, judo-points, blunt-tips, field points, fishing tips, etc.). The last component is the arrow's FLETCHING. The arrow's fletching is usually done with colorful parabolic shaped pieces of soft plastic (vanes) or feathers. In most cases, the three fletches are glued onto the shaft in an equally spaced circular pattern, with two fletches one color and the the third fletch a different color (the cock-fletch). The fletching is very important, as it provides steering and stabilization for the arrow during flight.

The proper method of measuring an arrow is to find the distance between the groove of the nock (where the string rests in the nock) to the end of the arrow's insert. Never include the tip when measuring an arrow. We measure and trim all arrows to length using this standard AMO (now the ATA) method. If you already have existing arrows which fit your bow properly, simply measure one by this method and order the same size. If you are unsure about what arrow length is appropriate for your bow setup, the next section may help.

Background: Measuring Draw Length of the Bow

The proper length for your arrow will depend upon several factors: the draw length for which the bow is set, the type of bow you have, and the type & position of your arrow rest.

Before we dive into this issue, we should briefly discuss how draw length is measured. Officially - according to the standard AMO method - a bow's draw length setting can be found by measuring the distance between the groove of the nock - to a position 1 3/4\"/>

Conveniently enough, for most bows, 1 3/4\"/>
