

Enzyme Review Worksheet

Part A: Define the following terms in your own words. Be clear and concise!

metabolism	all the chemical reactions that take place in living systems to maintain homeostasis
substrate	the substances that enter a specific reaction.
enzyme	proteins that serve as catalysts (they speed up reactions)
active site	the place on an enzyme where substrate(s) bind
coenzyme	non-protein organic molecules (e.g. NAD ⁺) that help enzymes to catalyze reactions or carry electrons, hydrogen, or functional groups stripped from substrates. Often complete the active site.
metabolic pathway	a stepwise sequence of reactions in cells, with specific enzymes catalyzing each step.
activation energy	the minimum amount of energy that colliding reactants must have in order for a chemical reaction to occur.

Part B: Fill the the blanks.

1. A metabolic pathway begins with a particular reactant, terminates with an end product, and has many minute steps in between. A reactant is a substance that participates in a reaction. A product is a substance that is formed by the reaction. The reactants in an enzymatic reaction are called the substrates for that enzyme.
2. An enzyme is a protein molecule that functions as an organic catalyst to speed up a chemical reaction.
3. The energy that must be added to cause molecules to react with one another is called the energy of activation. Enzymes lower the amount of energy for activation to occur.
4. When an enzyme forms a complex with its substrate, the small part of the enzyme that complexes with the substrate is called the active site. In the induced fit model, the active site undergoes a slight change in shape in order to accommodate the substrate. Only a small amount of enzyme is actually needed in a cell because enzymes are not used up.
5. Enzymes are very specific in their action and are named for their substrates.
6. As the temperature rises, why is there an increase in enzyme activity?
more effective collisions between enzyme and substrate as the temperature rises
7. When an enzyme's shape changes due to high temperature or extreme pH, the enzyme is said to be denatured. Enzymes that phosphorylate certain enzymes are called kinases, whereas phosphatases remove phosphate groups.
8. In competitive inhibition, another molecule is so close in shape to the enzyme's substrate that it can compete with the true substrate for the enzyme's active site. In non-competitive inhibition, a molecule binds to an enzyme, but not at the active site. This other site is called the allosteric site and can cause a shift in the three-dimensional structure.
9. In feedback inhibition, a product produced in high amounts by an enzymatic reaction can inhibit the enzyme's activity. The end product of an enzymatic pathway binds at an allosteric site on the first enzyme of the pathway.
10. Coenzymes are organic molecules that bind to enzymes and serve as carriers for chemical groups or electrons. Vitamins are small organic molecules that are required in trace amounts in our diet for synthesis of coenzymes.
11. Consider this metabolic pathway: $A \rightarrow E_1 \rightarrow B \rightarrow E_2 \rightarrow C \rightarrow E_3 \rightarrow D$
