

## Activity 10

Reading: [Genetic Variation in Cornelian Worksho](#) and genetic variation in [genetics](#) (complete your work on the following questions, understanding your understanding of the concepts discussed in the lesson)

1. Match each of the following changes in DNA sequence structure to its definition:

A. Deletion

B. Duplication

C. Inversion

D. Translocation

(a) a section of a chromosome is inserted

(b) a piece of a chromosome is deleted

(c) a large section of a chromosome has moved (inverted) to a different part of the chromosome

(d) a section of a chromosome appears to be on one chromosome but is on another

2. How many genetically different gametes can be produced from a diploid cell with four chromosomes pairs? Describe your answer.

There are 16 genetically different gametes that can be produced because in a diploid cell there are four chromosome pairs. Each pair can be separated into two different gametes.  $2^4 = 16$  genetically different gametes.

3. Although your offspring is a combination of both of your genes, you may notice that some traits seem to be inherited independently. For example, both of your eyes could be blue, but your hair color could be inherited together? Explain.

Yes, because some traits are linked and travel on the same chromosome. For example, hair color and eye color are linked, and a child with blue eyes and blonde hair will be blonde and blue eyes. The same is true for other traits, but not all are inherited together.

4. Describe the alignment of chromosomes during prophase I, write the equations:

Homologous chromosomes I synapse during joint homologous chromosomes stage crossing-over occurs. This is a reciprocal exchange of genetic material between sister chromatids and results in two double-stranded chromosomes.

5. How does nondisjunction lead to chromosomal abnormalities? Describe two types of genetic disorders that can result from nondisjunction.
