

# DOSAGE CALCULATION

## METHODS FOR DRUG DOSAGE CALCULATIONS

Various methods are used for solving medication calculation, the most common methods are :

- **Desired Over Have or Formula Method**
- **Dimensional Analysis Method**
- **Ratio and Proportion Method**

### Formula Method

$$\frac{\text{DESIRED (D)}}{\text{HAVE (H)}} \times \text{QUANTITY (Q)} = Y \text{ (amount to administer)}$$

Symbol	Meaning	Example
D	Dosage ordered or desired dose	<ul style="list-style-type: none"> <li>• Give 1.2 milliliters</li> <li>• The doctor orders 90 milligrams</li> </ul>
H	Dose on hand or dose, on the label of bottle, vial, ampule.	<ul style="list-style-type: none"> <li>• 250 milligrams</li> <li>• 100 mg</li> </ul> 
Q	The unit of measure for the specific dosage strength or supply on hand (the form in which the drug comes)	<ul style="list-style-type: none"> <li>• per tablet</li> <li>• per capsule</li> <li>• in 2 mL ....</li> </ul>
Y	The dosage you are trying to calculate	

**Example 1:** Ampicillin 1.5 g. is ordered. Ampicillin is available as 500 mg per capsules. How many tablets would the nurse administer?

- Desired (D) = 1.5 g = 1500 mg
- On hand (H) = 500 mg
- Quantity (Q) = 1 capsule

$$\frac{1500 \text{ mg}}{500 \text{ mg}} \times 1 \text{ (Capsule)} = 3 \text{ capsules}$$

Make sure that these units match up 

The nurse would administer 3 capsules

**Example 2:**

- Order: Acetaminophen 500 mg
- On hand: Acetaminophen 250 mg in 5 mL

- Desired (D) = 500 mg
- On hand (H) = 250 mg
- Quantity (Q) = 5 mL

$$\frac{500 \text{ mg}}{250 \text{ mg}} \times 5 \text{ mL} = 10 \text{ mL}$$

Make sure that these units match up 

The nurse would administer 10 mL of Acetaminophen

**Treatment Planning of High Dose-Rate Brachytherapy - Mathematical Modelling and Optimization** Björn Morén, 2021-01-12 Cancer is a widespread class of diseases that each year affects millions of people It is mostly treated with chemotherapy surgery radiation therapy or combinations thereof High dose rate HDR brachytherapy BT is one modality of radiation therapy which is used to treat for

example prostate cancer and gynecologic cancer In BT catheters i e hollow needles or applicators are used to place a single small but highly radioactive source of ionizing radiation close to or within a tumour at dwell positions An emerging technique for HDR BT treatment is intensity modulated brachytherapy IMBT in which static or dynamic shields are used to further shape the dose distribution by hindering the radiation in certain directions The topic of this thesis is the application of mathematical optimization to model and solve the treatment planning problem The treatment planning includes decisions on catheter placement that is how many catheters to use and where to place them as well as decisions for dwell times Our focus is on the latter decisions The primary treatment goals are to give the tumour a sufficiently high radiation dose while limiting the dose to the surrounding healthy organs to avoid severe side effects Because these aims are typically in conflict optimization models of the treatment planning problem are inherently multiobjective Compared to manual treatment planning there are several advantages of using mathematical optimization for treatment planning First the optimization of treatment plans requires less time compared to the time consuming manual planning Secondly treatment plan quality can be improved by using optimization models and algorithms Finally with the use of sophisticated optimization models and algorithms the requirements of experience and skill level for the planners are lower The use of optimization for treatment planning of IMBT is especially important because the degrees of freedom are too many for manual planning The contributions of this thesis include the study of properties of treatment planning models suggestions for extensions and improvements of proposed models and the development of new optimization models that take clinically relevant but uncustomary aspects into account in the treatment planning A common theme is the modelling of constraints on dosimetric indices each of which is a restriction on the portion of a volume that receives at least a specified dose or on the lowest dose that is received by a portion of a volume Modelling dosimetric indices explicitly yields mixed integer programs which are computationally demanding to solve We have therefore investigated approximations of dosimetric indices for example using smooth non linear functions or convex functions Contributions of this thesis are also a literature review of proposed treatment planning models for HDR BT including mathematical analyses and comparisons of models and a study of treatment planning for IMBT which shows how robust optimization can be used to mitigate the risks from rotational errors in the shield placement
