Name _____ # _____

Every living thing needs **energy** in order to live. Every time animals run, jump, or climb, they use energy to do so.

Animals get energy from the food they eat, and all living things get energy from food. Plants use sunlight, water and nutrients to get energy (in a process called **photosynthesis**). Energy is necessary for living beings to grow. A **food chain** shows how each living thing gets food, and how nutrients and energy are passed from creature to creature. Food chains begin with plant-life, and end with animal-life. Animals who eat only plants are called **herbivores** and animals who eat other animals are called **carnivores**. Some animals eat both plants and other animals. They are called **omnivores**. A simple food chain could start with grass, which is eaten by rabbits. Then the rabbits are eaten by foxes.

Another example of a food chain starts with acorns, which are eaten by mice. The mice are eaten by snakes, and then finally the snakes are eaten by hawks. At each link in the chain, energy is being transferred from one animal to another. There is actually even more to this chain. After a hawk dies, fungi (like mushrooms) and other **decomposers** break down the dead hawk, and turn the remains of the hawk into nutrients, which are released into the soil. The nutrients (plus sun and water) then cause the grass to grow.

Food chains make a full circle, and energy is passed from plant to animal (or animals), to decomposer, and back to plant.
