### I. Interactions Foundations CD/Contents/Tissue Level/Anatomy Overviews/Epithelial Tissues

- Where are epithelial tissues found? It covers the external surface of the body; it covers the internal and external organs. It forms secretory components of glands and lines the body cavities.

- Describe these three basic shapes of epithelial cells:

*squamous*: The cell is very flat with a flattened centrally located nucleus.

*cuboidal* - the cell is cube shaped with a round centrally located nucleus

*columnar*- the cell is rectangle shape with an oval centrally located nucleus

- What is the apical surface of epithelial tissue? What is the function of microvilli and cilia located on this surface?

Apical surface is exposed to the outside environment, the body cavity or the inner surface of hollow organs. Microvilli are finger like extensions of the cytoplasm and increase surface absorption. Cilia are hair like extensions of the apical surface. Designed to move substances across the surface.

- Describe the positional relationship between the epithelial surface cells, basal surface, basement membrane, and connective tissue. epithelial surface cell is the free surface or surface exposed; the basal surface is the bottom of the cell with underlying tissues below and basement membrane is the membrane between epithelial and underlying connective tissue

- Describe each of the following epithelial tissue arrangements:

*simple*: contain single layer of cells. Each cell contacts the basement membrane
