THE RESPIRATORY SYSTEM

The blood transports oxygen from the lungs to cells and carries carbon dioxide from the cells to the lungs. It is the function of the respiratory system to exchange gases with the cardiovascular system.

RESPIRATION

The respiratory system involves both external respiration and internal respiration. **External respiration** is the exchange of gases between the atmosphere and the blood. **Internal respiration** is the exchange of gases between the blood and the cells of the body. Once oxygen is in the cells, the cells use it to break down glucose and make ATP by the process of aerobic respiration. Without oxygen, the body could not obtain enough energy from food to survive. Excess carbon dioxide produced as a waste product of aerobic respiration is toxic to cells and is removed from the cells by internal respiration.

THE LUNGS

The **lungs** are the site of gas exchange between the atmosphere and the blood. Notice in Figure 46-16 that the right lung has three divisions, or lobes. It is slightly heavier than the two-lobed left lung. The lungs are located inside the thoracic cavity, bounded by the rib cage and the diaphragm. Lining the entire cavity and covering the lungs are pleura, membranes that secrete a slippery fluid that decreases friction from the movement of the lungs during breathing.

The Path of Air

Refer to Figure 46-16 to trace the path air follows from the atmosphere to the capillaries in the lungs. External respiration begins at the mouth and at the nose. Air filters through the small hairs of the nose and passes into the nasal cavity, located above the roof of the mouth. In the nasal cavity, mucous membranes warm and moisten the air, which helps prevent damage to the delicate tissues that form the respiratory system. The walls of the nasal cavity are also lined with cilia. These cilia trap particles that are inhaled and are eventually swept into the throat, where they are swallowed.

Evolutionary Gerontology and Geriatrics Giacinto Libertini, Graziamaria Corbi, Valeria Conti, Olga Shubernetskaya, Nicola Ferrara, 2021-05-25 This book provides concrete scientific basis that we can conceive the possibility of modifying or even completely canceling aging process despite the fact that aging is commonly regarded as the result of the overall effects of many uncontrollable degenerative phenomena The authors illustrate in detail the mechanisms by which cells and the whole organism age Actions by which it is possible or will be possible within a limited time to operate for modifying aging are also debated The discussion is conducted within the frame and the concepts of evolutionary medicine which is also indispensable for distinguishing between the manifestations of aging and i diseases that worsen with age and ii acceleration of normal aging rates caused by unhealthy lifestyle habits and other avoidable factors The book also discusses the impact of aging on overall mortality and the strange situation that according to official statistics aging does not exist as cause of death This book is a turning point between a gerontology and geriatrics conceived as the study and vain treatment of an incurable condition and one in which these disciplines examine the how and why of a physiological phenomenon that can be modified up to a possible total control This means transforming the medical prevention and treatment of physiological aging from the greatest failure to the greatest success of medicine
