

Evidence of Evolution

Students read a short passage and analyze a diagram to make a claim supported by evidence.

4. Embryology
 Some homologous structures are only visible in the embryos of organisms. An embryo is a very early stage in the development of a living being when it is just starting to form from a fertilized egg. The homologous structures visible in embryos often disappear as the organism develops further. However, these structures are clues to the evolutionary relationships between organisms.

The illustration shows some examples of the embryos of different animals. Notice the gill slits, tail, forelimb buds, and hindlimb buds in each animal's embryo.

Do the organisms in the diagram likely share a common ancestor?
 My Claim: _____

My Evidence: _____

Genetic Evidence in DNA
 Genetic material found in all organisms. Changes, or mutations, in DNA can lead to new traits in an organism. Mutations accumulate over time as organisms evolve. Biologists can determine evolutionary relationships between organisms by comparing their DNA. The more closely related two organisms are, the more similar the DNA of each organism is.

Directions: Read each text passage and examine the picture that goes with it. Then, answer the questions that follow.

1. Fossil Evidence
 Some of the most important evidence of evolution comes from fossils. Many fossils are found within rock layers. The oldest layers in a formation will usually be at the bottom, unless the formation has been disturbed by geological forces. Therefore, fossils found in these older layers are from organisms that lived a very long time ago. Organisms whose fossils are found in upper layers, but not lower ones, most likely evolved more recently. This is called the *law of superposition*.

Scientists can also tell when an organism went extinct if its fossils are not found above a certain point.

My Evidence: _____

My Reasoning: _____

Evolutionary Fossils
 Transitional fossils have characteristics that are somewhat similar to both earlier and later forms. These fossils show evolution in progress. For example, scientists can see the evolution of horses through the fossils of their leg bones. The earliest horse ancestor had a small body and a long neck.

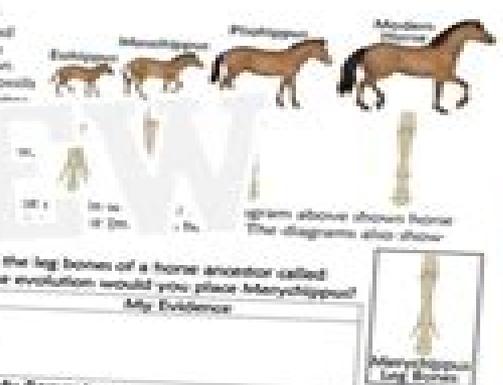

Look to the right, it shows the leg bones of a horse ancestor called *Merychippus*. The diagram also shows _____
