Programming languages: high to low level: pseudo > high > assembly > machine
- High level
  - Scripting: python perl javascript
  - Object oriented: C# C++ Java
  - Math: matlab, R
  - procedural/structured: C, Fortran, BASIC, Pascal
- Assembly
  - Java bytecode for JVM
- Machine
  - Binary
  - Machine code
  - Executable code

High level → compiler converts code into executable form→ lower form → interpreter translates while running program

Java compiled by Javac to bytecode → interpreted and run by JVM java virtual machine

Why is java universal?
- For most languages, compiler's executable only works on specific processor
- Javac compiles Java into a special portable executable, bytecode, that works on many dif devices. Each device has its own JVM which can execute/interpret bytecode

Programming phases
- Define & analyze, design, write code, test code, documentation, maintain/upgrade

3 types of program control
- Sequential (default)
- Decision
- Repetition (loops)
- ALL general purpose programming languages must have ways to do these 3 things

Sample run: what appears on the screen, including system printed output and your input

Pseudocode: non-coding version of code

Pseudocode tracing: following through pseudocode on paper
