Kaal,J.A. Sorensen,A. dominate current physics Using feedback from known experimental data they identified several organizational principles that nature appears to use for constructing the elements sometimes in unexpected ways There are two assumptions underlying the Structured Atom Model SAM First by replacing the neutron with a proton electron pair an electrostatic attractive force is reintroduced into the nucleus The electrons acting as glue between the protons Second that spherical dense packing gives the nucleus its fractal shape one of several organizational drivers in the buildup of the nucleus other drivers being recurring substructures called endings and nucleons A SAM nucleus is constructed using these substructures in various combinations The result is a new periodic table that hints at several missing elements most of which are suspected to be unstable but probably not all What emerges is nothing less than a new paradigm for thinking about the nucleus and physics In SAM several known nuclear phenomena follow directly from the structural configuration of the nucleus including nuclear instability radioactivity radioactive decay the asymmetrical breakup of fission products and the various nuclear decay schemes In addition the team discovered an unrecognized store of energy that may very well be responsible for Low Energy Nuclear Reactions LENR
