## Part 3: GridWorld Classes and Interfaces

In our example program, a grid contains actors that are instances of classes that extend the `Actor` class. There are two classes that implement the `Grid` interface: `BoardedGrid` and `EmptyGrid`. Locations in a grid are represented by objects of the `Location` class. An actor knows the grid in which it is located as well as its current location in the grid. The relationships among these classes are shown in the following figure.

### The Location Class

Every actor that appears has a location in the grid. The `Location` class encapsulates the coordinates for an actor's position in a grid. It also provides methods that determine relationships between locations and compass directions.

Every actor in the grid also has a direction. Directions are represented by compass directions measured in degrees: 0 degrees is north, 45 degrees is northeast, 90 degrees is east, etc. The `Location` class provides eight constants that specify the compass directions.
