Anomaly Detection in Video Surveillance
Xiaochun Wang,2024-08-06 Anomaly detection in video surveillance stands at the core of numerous real world applications that have broad impact and generate significant academic and industrial value The key advantage of writing the book at this point in time is that the vast amount of work done by computer scientists over the last few decades has remained largely untouched by a formal book on the subject although these techniques significantly advance existing methods of image and video analysis and understanding by taking advantage of anomaly detection in the data mining community and visual analysis in the computer vision community The proposed book provides a comprehensive coverage of the advances in video based anomaly detection including topics such as the theories of anomaly detection and machine perception for the functional analysis of abnormal events in general the identification of abnormal behaviour and crowd abnormal behaviour in particular the current understanding of computer vision development and the application of this present understanding towards improving video based anomaly detection in theory and coding with OpenCV The book also provides a perspective on deep learning on human action recognition and behaviour analysis laying the groundwork for future advances in these areas Overall the chapters of this book have been carefully organized with extensive bibliographic notes attached to each chapter One of the goals is to provide the first systematic and comprehensive description of the range of data driven solutions currently being developed up to date for such purposes Another is to serve a dual purpose so that students and practitioners can use it as a textbook while researchers can use it as a reference book A final goal is to provide a comprehensive exposition of the topic of anomaly detection in video media from multiple points of view

Low Rank and Sparse Modeling for Data Analysis Zhao Kang, 2017 Nowadays many real world problems

must deal with collections of high dimensional data High dimensional data usually have intrinsic low dimensional representations which are suited for subsequent analysis or processing Therefore finding low dimensional representations is an essential step in many machine learning and data mining tasks Low rank and sparse modeling are emerging mathematical tools dealing with uncertainties of real world data Leveraging on the underlying structure of data low rank and sparse modeling approaches have achieved impressive performance in many data analysis tasks Since the general rank minimization problem is computationally NP hard the convex relaxation of original problem is often solved One popular heuristic method is to use the nuclear norm to approximate the rank of a matrix Despite the success of nuclear norm minimization in capturing the low intrinsic dimensionality of data the nuclear norm minimizes not only the rank but also the variance of matrix and may not be a good approximation to the rank function in practical problems To mitigate above issue this thesis proposes several nonconvex functions to approximate the rank function However It is often difficult to solve nonconvex problem In this thesis an optimization framework for nonconvex problem is further developed The effectiveness of this approach is examined on several important applications including matrix completion robust principle component analysis clustering and recommender systems Another issue associated with current clustering methods is that they work in two separate steps including similarity matrix computation and subsequent spectral clustering The learned similarity matrix may not be optimal for subsequent clustering Therefore a unified algorithm framework is developed in this thesis To capture the nonlinear relations among data points we formulate this method in kernel space Furthermore the obtained continuous spectral solutions could severely deviate from the true discrete cluster labels a discrete transformation is further incorporated in our model Finally our framework can simultaneously learn similarity matrix kernel and discrete cluster labels The performance of the proposed algorithms is established through extensive experiments This framework can be easily extended to semi supervised classification
