Science Is Not A Quiet Life: Unravelling The Atomic Mechanism Of Haemoglobin Max F Perutz,1998-01-15 Linus Pauling called haemoglobin the most interesting and important of molecules This important volume shows how X ray crystallography was used to determine its bewilderingly complex atomic structure and to unravel the stereochemical mechanisms of its respiratory functions It introduces isomorphous replacement with heavy atoms which led to the first protein structures haemoglobin and its simpler relative myoglobin Later papers deal with the stereochemistry of the cooperative effects of haemoglobin with the relationships between the structures and impaired functions of abnormal haemoglobin with species adaptation of haemoglobin and with its action as a drug receptor and as an oxygen sensor The final papers deal with amino acid repeats which act as polar zippers and their role in certain inherited neurodegenerative diseases

have become a center of attention for those studying the control of proliferation differentiation cell polarity cell movement and vesicle and protein trafficking This book provides a complete guide to this area and should be essential reading for cell and molecular biologists biochemists and geneticists interested in these contemporary problems
