W. Wood, 2017-11-09 This is the first book to link the mod 2 Steenrod algebra a classical object of study in algebraic topology with modular representations of matrix groups over the field \mathbb{F} of two elements The link is provided through a detailed study of Peterson s hit problem concerning the action of the Steenrod algebra on polynomials which remains unsolved except in special cases The topics range from decompositions of integers as sums of powers of 2 minus 1 to Hopf algebras and the Steinberg representation of $GL(n, \mathbb{F})$ Volume 1 develops the structure of the Steenrod algebra from an algebraic viewpoint and can be used as a graduate level textbook Volume 2 broadens the discussion to include modular representations of matrix groups **Polynomial Completeness in Algebraic Systems** Kalle Kaarli, Alden F. Pixley, 2000-07-21 The study of polynomial completeness of algebraic systems has only recently matured and until now lacked a unified treatment Polynomial Completeness in Algebraic Systems examines the entire field with one coherent approach The authors focus on the theory of affine complete varieties but also give the primary known results on affine completeness in special varieties The book includes an extensive introductory chapter that provides the necessary background and makes the results accessible to graduate students as well as researchers Numerous exercises illustrate the theory and examples and counterexamples clarify the boundaries of the subject *From Polynomials to Sums of Squares*

Terence Hugh Jackson, 1995 This text and software describes a journey through the beautiful foothills of algebra and number theory based around the central theme of factorization It begins with very basic knowledge of rational polynomials gradually introduces other integral domains and eventually arrives at sums of squares of integers The treatment is made very concrete throughout the main text with illustrations using specific examples More abstract material is confined to appendices Other than familiarity with complex numbers and some elementary number theory very little mathematical prerequisites are needed The accompanying disk allows the reader to explore the subject further by removing the tedium of doing calculations by hand Throughout the text there are practical activities mostly involving the computer Polynomials Edward Barbeau, 1989 This book provides a backdrop for study in calculus modern algebra numerical analysis and complex variable theory through examples Includes some 300 problems drawn from journals contests and examinations to test understanding ingenuity and skill **Orthogonal Polynomials in MATLAB** Walter Gautschi, 2016-05-23 Techniques for generating orthogonal polynomials numerically have appeared only recently within the last 30 or so years Orthogonal Polynomials in MATLAB Exercises and Solutions describes these techniques and related applications all supported by MATLAB programs and presents them in a unique format of exercises and solutions designed by the author to stimulate participation Important computational problems in the physical sciences are included as models for readers to solve their own problems *Convex Analysis in Polynomial Spaces with Applications* Domingo García, Mingu Jung, Manuel Maestre, Gustavo A. Muñoz Fernández, Juan B. Seoane Sepúlveda, 2025-11-30 Convex Analysis in Polynomial Spaces with Applications is intended to serve a broad audience of undergraduate and graduate students junior and senior researchers and as a general self study guide for anyone who wishes to get acquainted with geometry of Banach spaces of polynomials with applications This text is specifically designed to be appealing and accessible to the reader and provides a general overview on the topic together with new and interesting directions of research The text also contains original results and material never published before Features Comprehensive review on the geometry of spaces of polynomials Visually attractive and accessible presentation with over 75 explanatory figures Contains many examples illustrating the results and techniques appearing in the book Open and deep questions within the area are provided so that the interested reader can begin doing independent research using the techniques presented in the text It also features original results by the authors *Solving Polynomial Equations* Alicia Dickenstein, Ioannis Z. Emiris, 2005-12-29 The subject of this book is the solution of polynomial equations that is systems of generally non linear algebraic equations This study is at the heart of several areas of mathematics and its applications It has provided the motivation for advances in different branches of mathematics such as algebra geometry topology and numerical analysis In recent years an explosive development of algorithms and software has made it possible to solve many problems which had been intractable up to then and greatly expanded the areas of applications to include robotics machine vision signal processing structural molecular biology computer aided design and geometric modelling as well as certain areas of

statistics optimization and game theory and biological networks At the same time symbolic computation has proved to be an invaluable tool for experimentation and conjecture in pure mathematics As a consequence the interest in effective algebraic geometry and computer algebra has extended well beyond its original constituency of pure and applied mathematicians and computer scientists to encompass many other scientists and engineers While the core of the subject remains algebraic geometry it also calls upon many other aspects of mathematics and theoretical computer science ranging from numerical methods differential equations and number theory to discrete geometry combinatorics and complexity theory The goal of this book is to provide a general introduction to modern mathematical aspects in computing with multivariate polynomials and in solving algebraic systems

Bilinear Forms and Zonal Polynomials Arak M. Mathai, Serge B. Provost, Takesi Hayakawa, 2012-12-06 The book deals with bilinear forms in real random vectors and their generalizations as well as zonal polynomials and their applications in handling generalized quadratic and bilinear forms The book is mostly self contained It starts from basic principles and brings the readers to the current research level in these areas It is developed with detailed proofs and illustrative examples for easy readability and self study Several exercises are proposed at the end of the chapters The complicated topic of zonal polynomials is explained in detail in this book The book concentrates on the theoretical developments in all the topics covered Some applications are pointed out but no detailed application to any particular field is attempted This book can be used as a textbook for a one semester graduate course on quadratic and bilinear forms and or on zonal polynomials It is hoped that this book will be a valuable reference source for graduate students and research workers in the areas of mathematical statistics quadratic and bilinear forms and their generalizations zonal polynomials invariant polynomials and related topics and will benefit statisticians mathematicians and other theoretical and applied scientists who use any of the above topics in their areas Chapter 1 gives the preliminaries needed in later chapters including some Jacobians of matrix transformations Chapter 2 is devoted to bilinear forms in Gaussian real random vectors their properties and techniques specially developed to deal with bilinear forms where the standard methods for handling quadratic forms become complicated
