# NAFA Guide to Air Filtration

Because filters add resistance to flow into the system, increasing filter pressure drop - **CORRECT ANSWER**-decreases air flow velocity.

Mechanical air filters - **CORRECT ANSWER**-remove dust by capturing it on the filter media, the material that comprises the filter element.

4 Different principles responsible for the capture of dust in a mechanical filter. - **CORRECT ANSWER**-

- Impingement
- Interception
- Diffusion
- Straining

Impingement - **CORRECT ANSWER**-Larger particles do not move around the fiber with the airstream and are carried into the fiber due to their speed, weight and size.

The effectiveness of the impingement process depends on the following: - **CORRECT ANSWER**-Dust particle size, density of the dust, depth of the filter, velocity of the airflow.

Interception - **CORRECT ANSWER**-Occurs when a dust particle follows the air streamlines, but still comes in contact with the fiber as it passes around it. interception is fiber-size dependent and is enhanced when the size of the fiber is closest to the size of the particle.

Diffusion - **CORRECT ANSWER**-Explains the capture of very small particles.

Brownian Motion - **CORRECT ANSWER**-The erratic path taken by minute particles because they are bombarded by other air (gas) molecules. This erratic path increases the probability that particles will come in contact with fibers.

Straining - **CORRECT ANSWER**-Occurs when the smallest dimension of a dust particles is greater than the distance between adjoining media fibers.

Adhesives - **CORRECT ANSWER**-Also known as Tackifiers Impingement filters are frequently treated with \_\_\_\_\_ that coat the fibers and create a bond between them and any dust particles that may impinge upon the fiber. This helps prevent the particle from being dislodged due to the velocity or vibration.
