1. Draw the Graph between (i) volume and temperature (ii) density and temperature for water when cooled from 100-degree celsius to 0-degree celsius. (2)
2. A steel wire of diameter 2 mm has breaking strength of 4×10^5 N. What is the breaking force of similar steel wire of diameter 1.5 mm? (2)
3. Write down the effect of temperature on (i) Surface tension (ii) Viscosity. (2)
4. If the density of the material increases, then what is the effect on Young's modulus? *no effect* (2)
5. The stress-strain graphs for materials A and B are shown in Fig. (a) Which of the materials has the greater Young's modulus? (b) Which of the two is the stronger material? (2)

6. Derive the relation for elastic potential energy for the stretched wire. (3)
7. The cylindrical tube of a spray pump has a cross-section of 8.0 cm^2 one end of which has 40 fine holes each of diameter 1.0 mm. If the liquid flow inside the tube is $1.5 \text{ m}^3 \text{ min}^{-1}$, what is the speed of ejection of the liquid through the holes? (3)
8. State and prove Bernoulli's Theorem. (3)

Canadian Journal of Physics, 2016 *Atomic and Molecular Physics of Controlled Thermonuclear Fusion* Charles Jean Joachain, Douglass Edmund Post, 1983-10 The need for long term energy sources in particular for our highly technological society has become increasingly apparent during the last decade One of these sources of tremendous potential importance is controlled thermonuclear fusion The goal of controlled thermonuclear fusion research is to produce a high temperature completely ionized plasma in which the nuclei of two hydrogen isotopes deuterium and tritium undergo enough fusion reactions so that the nuclear energy released by these fusion reactions can be transformed into heat and electricity with an overall gain in energy This requires average kinetic energies for the nuclei of the order of 10 keV corresponding to temperatures of about 100 million degrees Moreover the plasma must remain confined for a certain time interval during which sufficient energy must be produced to heat the plasma overcome the energy losses and supply heat to the power station At present two main approaches are being investigated to achieve these objectives magnetic confinement and inertial confinement In magnetic confinement research a low density plasma is heated by electric currents assisted by additional heating methods such as radio frequency heating or neutral beam injection and the confinement is achieved by using various magnetic field configurations Examples of these are the plasmas produced in stellarator and tokamak devices **TARGET**
