

Adult Echocardiography

Protocol for Adult TTE

PROCEDURES AND PROTOCOL

I. Getting Started

- A. Check for previous studies and review key elements.
- B. Optimize instrument settings prior to starting study.
- C. Verify indication for exam.
- D. Review order and understand physician's request.

II. Procedure Preparation

- A. Review the order for type of study to be performed. A verbal order may be used for stat echocardiography and written order will be obtained as soon as possible.
- B. Enter patient information into ultrasound system (from pick list or manually).
- C. Enter demographics, height, weight, BP, sonographer's name, all other information as needed.

III. Patient Preparation

- A. Explain procedure to patient.
- B. Verify patient ID.
- C. Instruct patient to lie on left side.
- D. Apply electrodes and attach leads.

IV. Digital Capture

- A. Make sure that you have adequate ECG signal.
- B. Patients in sinus rhythm, 2 beat captures are used.
- C. Patients in Afib or any irregular rhythm, 3-5 beat captures should be used as needed.
- D. When capturing a bubble contrast study use 5-10 second loops.

If images are suboptimal (when two or more LV segments cannot be visualized adequately for the assessment of LV function and regional wall motion assessment, and/or in settings in which the study indication requires accurate analysis of regional wall motion,) consider use of an ultrasound enhancing agent.

Basic Exam (note: obtain a 2D image of the view first, followed by color/spectral Doppler in order to provide anatomic orientation). In general, spectral Doppler and M-mode should be captured at a sweep speed of 50 mm/s speed. Use 25-50 mm/s speed to demonstrate respirophasic changes that require documentation of changes across several cardiac cycles and 100 mm/s speed when making timing measurements.

Optimization of Doppler signals. Doppler display occupies about 2/3 of scale for each velocity.

Pay particular attention to:

- Narrow aiming sector to optimize color and frame rate.
- If 2D imaging is poor (esp. in apical views) or two or more LV segments are unable to be assessed, ultrasound enhancing agents may be considered to enhance the image.
