Engineering Vibration Daniel J. Inman, 2001 This text presents material common to a first course in vibration and the integration of computational software packages into the development of the text material specifically makes use of MATLAB MathCAD and Mathematica This allows solution of difficult problems provides training in the use of codes commonly used in industry encourages students to experiment with equations of vibration by allowing easy what if

solutions This also allows students to make precision response plots computation of frequencies damping ratios and mode shapes This encourages students to learn vibration in an interactive way to solidify the design components of vibration and to integrate nonlinear vibration problems earlier in the text The text explicitly addresses design by grouping design related topics into a single chapter and using optimization and it connects the computation of natural frequencies and mode shapes to the standard eigenvalue problem providing efficient and expert computation of the modal properties of a system In addition the text covers modal testing methods which are typically not discussed in competing texts software to include Mathematica and MathCAD as well as MATLAB in each chapter updated Engineering Vibration Toolbox and web site integration of the numerical simulation and computing into each topic by chapter nonlinear considerations added at the end of each early chapter through simulation additional problems and examples and updated solutions manual available on CD for use in teaching It uses windows to remind the reader of relevant facts outside the flow of the text development It introduces modal analysis both theoretical and experimental It introduces dynamic finite element analysis There is a separate chapter on design and special sections to emphasize design in vibration
