6.2b A blown fuse can be identified by a break in its element

... a break in the element (see illustration), but if there is any doubt check the fuse for continuity (see Section 2). Each fuse is clearly marked with its rating and must only be replaced by a fuse of the correct rating. If a spare fuse is used, always replace it with a new one so that a spare of each rating is carried on the bike at all times.

**Warning:** Never put in a fuse of a higher rating or bridge the terminals with any other substitute, however temporary it may be. Serious damage may be done to the circuit, or a fire may start.

18 If the new fuse blows immediately check the wiring circuit very carefully for evidence of short-circuit. Look for bare wires and chafed, melted or burned insulation.

19 Occasionally a fuse will blow or cause an open-circuit for no obvious reason. Corrosion of the fuse ends and fusebox terminals may occur and cause poor fuse contact. If this happens, remove the corrosion with a wire brush or emery paper, then spray the fuse end and terminals with electrical contact grease.

## 6 Lighting system check

Refer to electrical system fault finding in Section 2 and to the wiring diagram for your model at the end of this Chapter.

6.3a Headlight relay (arrowed) - CB models

6.3b Headlight relay (arrowed) - CBF models

6.3c Relay test set-up

1 If a light fails, first check the bulb (see relevant Section), and the bulb terminals in the holder. If none of the lights work, check the battery (see Section 3). Low battery voltage indicates either a faulty battery or a defective charging system. Refer to Section 3 for battery checks and Section 28 for charging system tests. Also check the fuses (Section 5) - if there is more than one problem at the same time, it is likely to be a fault relating to a multi-function component, such as one of the fuses governing more than one circuit, or the ignition switch. When checking for a blown filament in a bulb, it is advisable to back up a visual check with a continuity test of the filament as it is not always apparent that a bulb has blown.

## Headlight

### CB600F/FA 2007 to 2010 and CBF600S/SA

2 These models have two single filament bulbs - the left-hand bulb works on LO beam and both bulbs work on HI beam. If one headlight beam fails to work, first check the bulb (see Section 7). If both headlight beams fail to work, first check the fuse (see Section 5), and then the bulbs (see Section 7). If they are good, the problem lies in the wiring or connectors, the HI beam relay or the dimmer switch. Refer to Section 19 for the switch testing procedures, and also to the wiring diagrams at the end of this Chapter.

3 If the HI beam does not work and the relay is suspected of being faulty, on CB600F/FA models remove the seat cowl, and on CBF600S/SA models remove the left-hand seat cowl (see Chapter 7). Pull the relay off its connector and test it as follows (see illustrations): set a multimeter to the ohms x 1 scale and connect it across the relay's A and B terminals. There should be no continuity (infinite resistance). Using a fully-charged 12 volt battery and two insulated jumper wires, connect the positive (+) terminal of the battery to the C terminal on the relay, and the negative (-) terminal to the D terminal. At this point the relay should be heard to click and the meter read 0 ohms (continuity). If this

is the case the relay is good. If the relay does not click when battery voltage is applied and indicates no continuity (infinite resistance) across its terminals, it is faulty and must be replaced with a new one.

4 If the relay is good, check there is battery voltage at the black/red wire terminal on the relay wiring connector with the ignition ON. If there is no voltage, check the wiring between the relay wiring connector and the ignition switch, via the fusebox. If voltage is present, refer to Section 7 (CBF models) or 8 (CB models) and check the blue/black wire between the relay connector and the headlight connector, and the blue wire between the relay connector and the dimmer switch for continuity, and check there is continuity to earth (ground) in the green/black (CB600F/FA models) or green (CBF600S/SA models) wire from the headlight connector, and in the green wire from the relay connector. Repair or renew the wiring or connectors as necessary.

5 If the LO beam does not work, refer to Section 7 (CBF models) or 8 (CB models) and check for battery voltage at the blue/white wire terminal on the headlight wiring connector with the ignition ON. If voltage is present, check for continuity to earth (ground) in the green/black (CB600F/FA models) or green (CBF600S/SA models) wire from the wiring connector. If no voltage is present check the blue/white wire from the connector to the starter button and the dimmer switch, and then check the switches themselves, and then the wiring between them and the fusebox. Repair or renew the wiring or connectors as necessary.

### CB600F/FA 2011-on, CBF600N/NA and CBR600F/FA

6 These models have one twin filament bulb. If both headlight beams fail to work, check the fuse (see Section 5). If either the LO beam or the HI beam fails to work check the bulb (see Section 7). If all seems good, the problem lies in the wiring or connectors, or the dimmer switch. Refer to Section 19 for the switch testing procedures.

7 If the HI beam does not work, refer to Section 7 and check for battery voltage at the blue wire terminal on the headlight wiring
