

Calibrate Your Powder

It would be difficult to measure the volume of one grain of powder and not very precisely. However, it is very easy to weigh a large sample of known volume and calculate the volume of a single grain.

To find the exact volume of a single grain of your powder, set your powder measure to any setting, preferably a large whole number such as 4.00 or 5.00.

Weigh a sample. Divide the microscale reading by the weight to find volume of a single grain of the powder you're testing. Mark this number on the powder container and you'll have it for reference in the future. Average of several samples increases accuracy and confidence.

$$\frac{\text{Microscale reading}}{\text{Grains weight of sample}} = \text{setting for one grain (in) (VMD)}$$

In a perfect world you would weigh again here to weigh a charge for the container of your fire. However, if anything can go wrong it will at the worst possible time. For this reason, we strongly urge you to check your charge with a scale every time you reset your measure.

Grain, Granules and Cable Containers

The grain, as used to measure gunpowder, should not be confused with a granule or kernel of powder.

A **grain** was so named because it was the weight measure equal to one plumb grain of wheat. A **grain** is a grain in a grain smaller using avoirdupois, troy or apothecaries weight. The retailer uses the avoirdupois system where there are 7000 grains or 10 ounces to one pound. The same system we use daily in the USA to buy and sell gunpowder, black powder, etc.

A **container** is .0001 of an inch.

There are over 40 cable containers to one cable inch.

A **line** is 1000 cable containers and will hold 1/16th of an inch.

A cable container of water weighs one grain or 0.032 grams.

$$\text{grains} \times 15.432 = \text{grams}$$

$$\text{grams} / 15.432 = \text{grains}$$

Lee Safety Powder Scale

Magnetically designed and Approach to weight

Safety and accuracy are the most important features. Easy to read and set. Calibrated with weight measure to the highest accuracy ever achieved. Even if you already own a conventional bullet and powder scale, you will thank a Lee Safety Powder Scale. **MSRP**

Volume Measure Density (VMD) Volume of 1 Grain of Powder

This is a tool you can use to determine the average volume of one grain of a specific powder when measured to the average density.

The other feature is the part of a scale container that is needed to hold one grain of the powder selected. Scale containers are selected as a standard set only because that is what the powder companies use. But a scale can be a comparatively large unit. To obtain the same degree of accuracy, it would be necessary to use the container and the scale above.

To find the volume available in a charge, simply multiply the charge in grains by the number below the powder you are using. For this case to set our measure to that number.
