

Quiz & Worksheet - Types of Electromagnetic Induction

1. Mutual inductance is:

- the ability of a current carrying conductor to induce a voltage in another conductor through a mutual magnetic field.
- the ability of a conductor to induce a magnetic field in another current carrying conductor.
- the ability of a magnetic field to induce a voltage in a current carrying conductor.
- the ability of current carrying conductor to produce a changing magnetic field.
- the ability of a current carrying conductor to induce a current in another conductor through a mutual magnetic field.

2. In a transformer, the ratio between the primary voltage and the secondary voltage is equal to:

- the ratio between the number of turns in the primary coil and the number of turns in the secondary coil.
- the ratio between the current in the primary coil and the current in the secondary coil.
- the ratio between the magnetic field in the primary coil and the magnetic field in the secondary coil.
- the ratio between the power in the primary coil and the power in the secondary.
- the inverse of the ratio between the number of loops in the primary coil and the number of loops in the secondary coil.

3. In order for a transformer to work:

- the magnetic field must be changing.
- the magnetic field must not change.
- it must be connected to a direct current source.
- the primary coil and the secondary coil must have different numbers of turns.
- the number of turns in the secondary coil must be greater than the number of turns in the primary coil.
