Automated Verification of Concurrent Search Structures Siddharth Krishna,Nisarg Patel,Dennis Shasha,Thomas Wies,2022-05-31 Search structures support the fundamental data storage primitives on key value pairs insert a pair delete by key search by key and update the value

associated with a key Concurrent search structures are parallel algorithms to speed access to search structures on multicore and distributed servers These sophisticated algorithms perform fine grained synchronization between threads making them notoriously difficult to design correctly Indeed bugs have been found both in actual implementations and in the designs proposed by experts in peer reviewed publications The rapid development and deployment of these concurrent algorithms has resulted in a rift between the algorithms that can be verified by the state of the art techniques and those being developed and used today The goal of this book is to show how to bridge this gap in order to bring the certified safety of formal verification to high performance concurrent search structures Similar techniques and frameworks can be applied to concurrent graph and network algorithms beyond search structures

Higher-Level Hardware Synthesis Richard Sharp,2004-03-18 In the mid 1960s when a single chip contained an average of 50 transistors Gordon Moore observed that integrated circuits were doubling in complexity every year In an influential article published by Electronics Magazine in 1965 Moore predicted that this trend would continue for the next 10 years Despite being criticized for its unrealistic optimism Moore s prediction has remained valid for far longer than even he imagined today chips built using state the art techniques typically contain several million transistors The advances in fabrication technology that have supported Moore s law for four decades have fuelled the computer revolution However this exponential increase in transistor density poses new design challenges to engineers and computer scientists alike New techniques for managing complexity must be developed if circuits are to take full advantage of the vast numbers of transistors available In this monograph we investigate both i the design of high level languages for hardware description and ii techniques involved in translating these hi level languages to silicon We propose SAFL a rst order functional language designedspeci callyforbehavioralhardwaredescription anddescribetheimp mentation of its

associated silicon compiler We show that the high level properties of SAFL allow one to exploit program analyses and optimizations that are not employed in existing synthesis systems Furthermore since SAFL fully abstracts the low level details of the implementation technology we show how it can be compiled to a range of different design styles including fully synchronous design and globally asynchronous locally synchronous GALS circuits
