

Motion in a Straight Line

A Quick Recapitulation of the Chapter

- Kinematics** is the branch of physics that deals with the study of motion without going to the cause of motion.
- Total length of the path traversed by an object during motion is called **distance** or **total path length**. It is a scalar quantity. It cannot be negative or zero.
- The shortest distance between the initial and final positions of any object is called its **displacement**. It is a vector quantity. It can be positive, negative or zero.
- If an object moves along the straight line covering equal distance in equal intervals to time, it is said to be in a **uniform motion**. The position-time graph of such a motion is given by

- Average velocity** is defined as the change in position or displacement (Δx) divided by the time interval (Δt), in which the displacement occurs.

$$\bar{v} = \frac{\Delta x}{\Delta t} = \frac{x_2 - x_1}{t_2 - t_1}$$

where, x_2 and x_1 are the positions of the object at time t_2 and t_1 , respectively. It can be positive or negative depending upon the sign of the displacement.

- Average speed** is defined as the total path length travelled divided by the total time interval during which the motion has taken place.

$$\text{Average speed} = \frac{\text{Total path length}}{\text{Total time interval}}$$

It is always positive.

- Instantaneous velocity** at any instant is defined as the limit of the average velocity as the time interval Δt becomes infinitesimally small, i.e.,

$$v = \lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} = \frac{dx}{dt}$$

Here, $\lim_{\Delta t \rightarrow 0}$ stands for the operation of taking limit as $\Delta t \rightarrow 0$ of the quantity on its right. $\frac{dx}{dt}$ is the rate of

change of position with respect to time at that instant.

- The time rate of change of velocity is called **acceleration**.

$$\text{Acceleration, } a = \frac{\text{Change in velocity}}{\text{Time interval}}$$

Its unit is ms^{-2} and it is a vector quantity.

- The **average acceleration** \bar{a} over a time interval is defined as the change of velocity divided by the time interval.

$$\bar{a} = \frac{v_2 - v_1}{t_2 - t_1} = \frac{\Delta v}{\Delta t}$$

where, v_2 and v_1 are the instantaneous velocities at times t_2 and t_1 .

- Instantaneous acceleration** of an object is the first time derivative of velocity at a given instant.

$$a = \frac{dv}{dt} = \frac{d^2x}{dt^2} \text{ or } a = \lim_{\Delta t \rightarrow 0} \frac{\Delta v}{\Delta t}$$
