Numerical Development - From cognitive functions to neural underpinnings Korbinian Moeller, Elise Klein, Klaus F Willmes - von Hinckeldey, Karin Kucian, 2015-02-24 Living at the beginning of the 21st century requires being numerate because numerical abilities are not only essential for life prospects of individuals but also for economic interests of post industrial knowledge societies Thus numerical development is at the core of both individual as well as societal interests There is the notion that we are already born with a very basic ability to deal with small numerosities Yet this often called number sense seems to be very restricted approximate and driven by perceptual constraints During our numerical development in formal e g school but also informal contexts e g family street we acquire culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic digits refining our numerical capabilities In recent years numerical development has gained increasing research interest documented in a growing number of behavioural neuro scientific educational cross cultural and neuropsychological studies addressing this issue Additionally our understanding of how numerical competencies develop has also benefitted considerably from the advent of different neuro imaging techniques allowing for an evaluation of developmental changes in the human brain In sum we are now starting to put together a more and more coherent picture of how numerical competencies develop and how this development is associated with neural changes as well In the end this knowledge might also lead to a better understanding of the reasons for atypical numerical development which often has grievous consequences for those who suffer from developmental dyscalculia or mathematics learning disabilities Therefore this Research Topic deals with all aspects of numerical development findings from behavioural performance to underlying neural substrates from cross sectional to longitudinal evaluations from healthy to clinical populations To this end we included empirical contributions using different experimental methodologies but also theoretical contributions review articles or opinion papers

Immune system modeling and analysis Ramit Mehr,Miles Davenport,2015-04-22 The rapid development of new methods for immunological data collection from multicolor flow cytometry through single cell imaging to deep sequencing presents us now for the first time with the ability to analyze and compare large amounts of immunological data in health aging and disease The exponential growth of these datasets however challenges the theoretical immunology community to develop methods for data organization and analysis Furthermore the need to test hypotheses regarding immune function and generate predictions regarding the outcomes of medical interventions necessitates the development of mathematical and computational models covering processes on multiple scales from the genetic and molecular to the cellular and system scales The last few decades have seen the development of methods for presentation and analysis of clonal repertoires those of T and B lymphocytes and phenotypic surface marker based repertoires of all lymphocyte types and for modeling the intricate network of molecular and cellular interactions within the immune systems This e Book which has first appeared as a *Frontiers in Immunology* research topic provides a comprehensive online open access snapshot of the current state of the art on immune system modeling and analysis

Sudden arrhythmic death: from basic science to clinical practice Gareth D. Matthews,2014-10-02 With upwards of 4 5 million deaths worldwide each year and more than one tenth of these occurring in those with no previously documented heart disease sudden arrhythmic death SAD is both a major public health burden and a highly emotive issue for society at large Recent years have witnessed a marked expansion in our knowledge of the physiology underlying SAD both in the context of hereditary and acquired cardiac disorders Thanks largely to work in genetically modified animals the growth in our understanding of mechanisms underlying arrhythmia in the hereditary channelopathies has been particularly marked Our growing knowledge of the fundamental mechanisms underlying SAD has so far failed to spur substantial developments in clinical practice Despite a large body of work in both humans and animals it remains impossible to confidently identify those at high risk of SAD making pre-emptive therapy a challenge What is more with the thankful exception of the implantable cardioverter defibrillators and pharmacological agents in very specific situations there has been depressingly little progress in finding new and effective therapies This Research Topic aims to go some way towards bridging the gap between advances in basic science and the development and delivery of new therapies It brings together original research contributions and review articles from key opinion leaders in the field focusing on the direct clinical implications of the basic science research now and in the future *Journal for Research in Mathematics Education* ,2014 *Japan's Official Development Assistance*
