Micro and Nanofluid Convection with Magnetic Field Effects for Heat and Mass Transfer Applications using MATLAB® Chakravarthula S K Raju, Ilyas Khan, Suresh Kumar Raju S, Mamatha S Upadhya, 2022-06-02. Micro and Nanofluid Convection with Magnetic Field Effects for Heat and Mass Transfer Applications using MATLAB examines the performance of micro and nanofluids with various physical effects such as magnetic field slip effects, radiation, and heat sources. Heat and mass transfer enhancement techniques are widely used in many applications in the heating and cooling or freezing process to make possible a reduction in weight and size or enhance performance during heat and mass exchanges. The book covers the two categories of flow techniques: active and passive. It discusses various considerations in the engineering sciences in the melting process, polymer industry, and in metallurgy. To be more precise, it may be pointed out that many metalurgical developments involve the cooling of continuous strips or filaments by drawing them through a quiescent fluid, and in that process of drawing, these strips are sometimes stretched. In all these cases, the properties of the final product depend to a great extent on the rate of cooling by drawing such strips in an electrically conducting fluid subject to a magnetic field and thermal radiation. Provides information about the governing equations for all three types of flow geometries. Explains micro-polar fluid flow modeling. Offers detailed coverage of boundary value problems using MATLAB.
