## INTRODUCTION

One of the most convenient ways to communicate, especially when discussing machines or their components, is through engineering drawings. An engineering drawing is a type of drawing that is technical in nature and is used to fully and clearly define the requirements for manufacturing objects. It is usually prepared in accordance with basic principles and standardized conventions for the layout, nomenclature, lines and symbolic representations. As these drawings follow standard conventions, engineers can use them to communicate with each other anywhere in the world. Therefore, engineering drawing is often called the universal language of engineers. Learning to create and understand these drawings is, thus, very important for all engineering students. In India, engineering drawings are prepared according to the basic principles, standard conventions, symbolic representations and notations recommended by the Bureau of Indian Standards (BIS).

## 1.2 DRAWING INSTRUMENTS

An engineering drawing can be prepared manually using drafting instruments or through a computer-aided drafting. The accuracy of drawings and speed of execution depend upon the quality of drawing instruments. It is, therefore, desirable for students to procure instruments of good quality.

The following drawing instruments are commonly used:

- |                                  |                       |
|----------------------------------|-----------------------|
| (i) Drawing board                | (viii) Pencils(HB,3H) |
| (ii) 45° and 30°–60° set squares | (ix) Erasers          |
| (iii) Engineers' scales          | (x) (xvii) T-square   |
| (iv) Protractor                  |                       |
| (v) Irregular or French curves   |                       |

**A Tale of Two Bridges** Stephen Mikesell, 2017-04-03 A Tale of Two Bridges is a history of two versions of the San Francisco Oakland Bay Bridge the original bridge built in 1936 and a replacement for the eastern half of the bridge finished in 2013 The 1936 bridge revolutionized transportation in the Bay Area and profoundly influenced settlement patterns in the region It was also a remarkable feat of engineering In the 1950s the American Society of Civil Engineers adopted a list of the Seven Engineering Wonders of the United States The 1936 structure was the only bridge on the list besting even the more famous Golden Gate Bridge One of its greatest achievements was that it was built on time in less than three years and came in under budget Mikesell explores in fascinating detail how the bridge was designed by a collection of the best known engineers in the country as well as the heroic story of its construction by largely unskilled laborers from California joined by highly skilled steel workers By contrast the East Span replacement which was planned between 1989 and 1998 and built between 1998 and 2013 fell victim to cost overruns in the billions of dollars was a decade behind schedule and suffered from structural problems that has made it a perpetual maintenance nightmare This is narrative history in its purest form Mikesell excels at explaining highly technical engineering issues in language that can be understood and appreciated by general readers Here is the story of two very important bridges which provides a fair but uncompromising analysis of why one bridge succeeded and the other did not

*Reinventing Warfare 1914-18* Anthony Saunders, 2011-12-08 No army went to war in 1914 ready to conduct trench warfare operations All the armies of the First World War discovered that prolonged trench warfare required new types of munitions alongside the conventional howitzers large calibre guns and explosive shells This volume examines how the British went about inventing and manufacturing new weaponry such as hand grenades rifle grenades and trench mortars when no body of knowledge about trench warfare munitions existed It also examines how tactics were developed for these new munitions Based on new research this is the first book to discuss the complexity of invention and manufacture of novel weapons such as the Mills grenade and the Stokes mortar and to consider the relationship between technical design and operational tactics on the ground In so doing the book presents a different model of the trench warfare conducted by the British Expeditionary Force on the Western Front and also provides a blueprint to understanding the relationship between technology and tactics applicable to all types of weapons and warfare

Crafting Preservation Criteria John H. Sprinkle, Jr., 2014-03-05 In 1966 American historic preservation was transformed by the passage of the National Historic Preservation Act which created a National Register of Historic Places Now comprising more than 14 million historic properties across the country the National Register is the official federal list of places in the United States thought to be worthy of preservation One of the fundamental principles of the National Register is that every property is evaluated according to a standard set of criteria that provide the framework for

understanding why a property is significant in American history The origins of these criteria are important because they provide the threshold for consideration by a broad range of federal preservation programs from planning for continued adaptive use to eligibility for grants and inclusion in heritage tourism and educational programs Crafting Preservation Criteria sets out these preservation criteria for students explaining how they got added to the equation and elucidating the test cases that allowed for their use From artworks to churches from the fifty year rule to the historic scene students will learn how places have been historically evaluated to be placed on the National Register and how the criteria evolved over time

Computation Works Xavier De Kestelier,Brady Peters,2013-04-15 Architects are now taking advantage of the computer in new ways through experimentation with algorithmic and simulation driven design Computation Works The Building of Algorithmic Thought focuses on this emerging theme in design practice showcasing built and soon to be built projects and providing a state of the art in computational design Computational design is considered to be first a design tool and second a series of instruments that can be applied in the creation of architecture It allows architects to incorporate performance analysis and knowledge about material tectonics and the parameters of production machinery Moving towards a new role as hybrid practitioners architects are taking concepts from other disciplines and customising architectural and other CAD software In addition to the discussion of built projects a further series of texts examines new custom software instruments New digital tools provide new modes of representation new methods of evaluation and new techniques for design exploration The development of new computational tools can create more responsive designs allowing architects to explore new design options and to analyse architectural decisions during the design process This issue raises important questions such as How is computation changing the way architects design Are the design tools and methods related to the result What is computational design in the context of architectural practice and How is computation changing the processes of design and construction
