Two Devices for Analysis of Nystagmus Fred E. Guedry (Jr.), 1967 Two devices are described which facilitate measurement and analysis of nystagmus One device requires manual alignment of a crosshair with the nystagmus slope This process is much faster than unaided manual scoring because 1 the mechanical aid in slope measurement is very effective 2 time measurement is virtually automatic and 3 all steps after the crosshair alignment including tabulation of digital information and plotting of analog information are accomplished automatically The second device is a standard recorder with

plug in units for area summation and timed switching It is less versatile than the first device and is not equivalent to advanced electronic computation but it does provide an immediate analog display and with a digital voltmeter printer an immediate digital display of analyzed nystagmus Additional operations performed on the output of these devices can provide estimates of the pi delta time constant and other parameters Topics discussed include sources of error in rapid processing of nystagmus and advantages of rapid processing for experimental purposes for pilot evaluation and for clinical application
