Whitlock, 2017-03-21 The essential one volume reference to evolution The Princeton Guide to Evolution is a comprehensive concise and authoritative reference to the major subjects and key concepts in evolutionary biology from genes to mass extinctions Edited by a distinguished team of evolutionary biologists with contributions from leading researchers the guide contains some 100 clear accurate and up to date articles on the most important topics in seven major areas phylogenetics and the history of life selection and adaptation evolutionary processes genes genomes and phenotypes speciation and macroevolution evolution of behavior society and humans and evolution and modern society Complete with more than 100 illustrations including eight pages in color glossaries of key terms suggestions for further reading on each topic and an index this is an essential volume for undergraduate and graduate students scientists in related fields and anyone else with a serious interest in evolution Explains key topics in some 100 concise and authoritative articles written by a team of leading evolutionary biologists Contains more than 100 illustrations including eight pages in color Each article includes an outline glossary bibliography and cross references Covers phylogenetics and the history of life selection and adaptation evolutionary processes genes genomes and phenotypes speciation and macroevolution evolution of behavior society and humans and evolution and modern society *Dynamic Patterns* J. A. Scott Kelso, 1995 foreword by Hermann Haken For the past twenty years Scott Kelso's research has focused on extending the physical concepts of self organization and the mathematical tools of nonlinear dynamics to understand how human beings and human brains perceive intend learn control and coordinate complex behaviors In this book Kelso proposes a new general framework within which to connect brain mind and behavior Kelso's prescription for mental life breaks dramatically with the classical computational approach that is still the operative framework for many newer psychological and neurophysiological studies His core thesis is that the creation and evolution of patterned behavior at all levels from neurons to mind is governed by the generic processes of self organization Both human brain and behavior are shown to exhibit features of pattern forming dynamical systems including multistability abrupt phase transitions crises and intermittency *Dynamic Patterns* brings together different aspects of this approach to the study of human behavior using simple experimental examples and illustrations to convey essential concepts strategies and methods

with a minimum of mathematics Kelso begins with a general account of dynamic pattern formation He then takes up behavior focusing initially on identifying pattern forming instabilities in human sensorimotor coordination Moving back and forth between theory and experiment he establishes the notion that the same pattern forming mechanisms apply regardless of the component parts involved parts of the body parts of the nervous system parts of society and the medium through which the parts are coupled Finally employing the latest techniques to observe spatiotemporal patterns of brain activity Kelso shows that the human brain is fundamentally a pattern forming dynamical system poised on the brink of instability Self organization thus underlies the cooperative action of neurons that produces human behavior in all its forms
