GENETIC MUTATIONS

For High School Biology Students

INTRO TO MUTATIONS

The sequence of bases in DNA are like the sentences within a book. They tell a story. But what would happen if those letters were changed? What would this do to the story? Just like editing mistakes in books, cells sometimes also make mistakes when copying DNA.

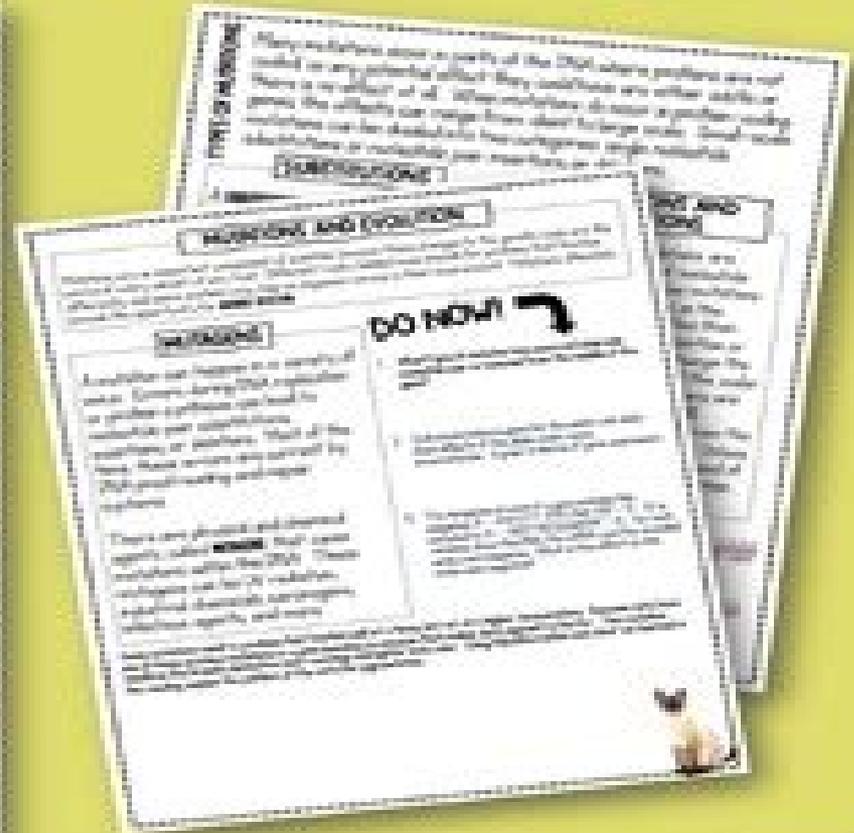

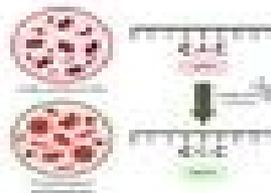

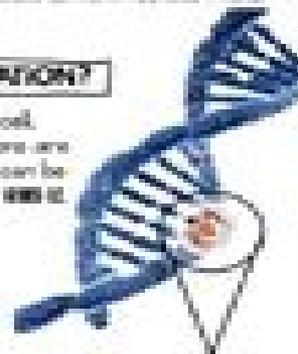

WHAT IS A MUTATION?

When a change occurs to the genetic information of a cell, the cell experiences something called a **MUTATION**. Mutations are responsible for genetic diversity. And while mutations can be bad, they also can be good. **MUTATIONS ARE RESPONSIBLE FOR ALL NEW TYPES OF BEING ON EARTH.**

POINT MUTATIONS

POINT MUTATIONS are mutations that affect a single nucleotide. These types of mutations typically result in a **SUBSTITUTION** where one nucleotide is changed to a different nucleotide. If these mutations occur within a gene, it may be transmitted to the offspring and over future generations. If the mutation results in a phenotype that harms the individual we call this a **HAZARDOUS** or **DESTRUCTIVE** MUTATION.

SICKLE-CELL DISEASE is an example of a point mutation. In the case of sickle-cell disease, the change of a single nucleotide within the DNA changes the code within the mRNA and ultimately the protein for hemoglobin. The result is a sickle-shaped red blood cell. Another disease that is caused by a point mutation is **phenylketonuria**, resulting in the tragic death of some young children.

An Overview.* Dr.HAKIM ,2020-04-09 Each cell depends on thousands of proteins to do their jobs in the right places at the right times to function correctly Sometimes gene mutations prevent one or more of these proteins from working properly By changing a gene s instructions for making a protein a mutation can cause the protein to malfunction or to be missing entirely When a mutation alters a protein that plays a critical role in the body it can disrupt normal development or cause a medical condition A condition caused by mutations in one or more genes is called a genetic disorder In some cases gene mutations are so severe that they prevent an embryo from surviving until birth These changes occur in genes that are essential for development and often disrupt the development of an embryo in its earliest stages Because these mutations have very serious effects they are incompatible with life It is important to note that genes themselves do not cause disease genetic disorders are caused by mutations that make a gene function improperly For example when people say that someone has the cystic fibrosis gene they are usually referring to a mutated version of the CFTR gene which causes the

disease All people including those without cystic fibrosis have a version of the CFTR gene An attempt has been made in this informative Booklet to summarize the fundamental topics related to genetic mutations and its impact on health and development along with several illustrations Dr H K Saboowala M B Bom M R S H London **Jekel's Epidemiology, Biostatistics and Preventive Medicine E-Book** Joann G.
