

**MISSION 4 Biogeography: Where Life Lives**

Introductory video: Life does not stay in one place. Organisms spread out and move around. Plant seeds and fungal spores are carried by the wind and animals cover great distances in search of food. And bacteria? Well, bacteria are just everywhere. But it isn't just organisms that move—the planet's tectonic plates move, too. The goal of biogeography is to piece together all of these movements to discover and explain the past and present distribution of life on Earth. It's a big puzzle with as many moving pieces as there are species that have ever lived. Before you start the first level in this mission, "Saving Hawaiian treasure," watch the introductory video and answer Questions 1–4 below.

1. **How do organisms come to live on newly formed volcanic islands?**
2. **The Galápagos finches are an example of an array of species that:**
 - a. Migrated to an island as a group
 - b. Evolved from a single island species
 - c. Interbred to form one new island species
 - d. Each independently migrated to an island
3. **What is Pangaea?**
 - a. An island in Hawaii
 - b. An ancient supercontinent
 - c. A species of Hawaiian honeycreeper
 - d. An ancient common ancestor of birds
4. **Explain how a close relative of an African plant came to be living in the tropical Pacific.**
