point out to positive effects of maternal education I find evidence of maternal education being endogenous and possibly contaminated with measurement error There is evidence suggesting that maternal education might be related to public health services through a substitution effect Results also reveal that mother s labor supply is negatively associated with hemoglobin levels In the third essay I examine whether sexual and reproductive behavior of Mexican women changed due to public initiatives promoting birth control and family planning launched in the 1970s I use a variety of indicators to characterize sexual and reproductive behavior first sexual encounter first and second pregnancies and utilization of contraceptive methods To identify the effects of public programs I make use of individual exposure to in school sexual education and to birth control promotion in public health facilities Results suggest that in school sex education increased the hazard of first sexual intercourse but did not affect the hazard of first pregnancy Both sex education in schools and exposure to campaigns in public health facilities decreased the hazard of a second pregnancy There is also some evidence supporting positive effects of sex education on the use of contraception methods
