

Gamma-rays are detected by a spectrometer (on board the aircraft) composed of large crystals (e.g. Cesium-iodine) that emit weak light pulses when hit by gamma quantum. Depending on the radioactive element, the pulses show characteristic energy levels in the range of 0-3 MeV (Mega-electronVolts) that form peaks attributed to K, U and Th in the energy spectrum (see Diag. 'a'). The number of gamma-ray counts across the whole spectrum are referred to as the Total Count (TC).

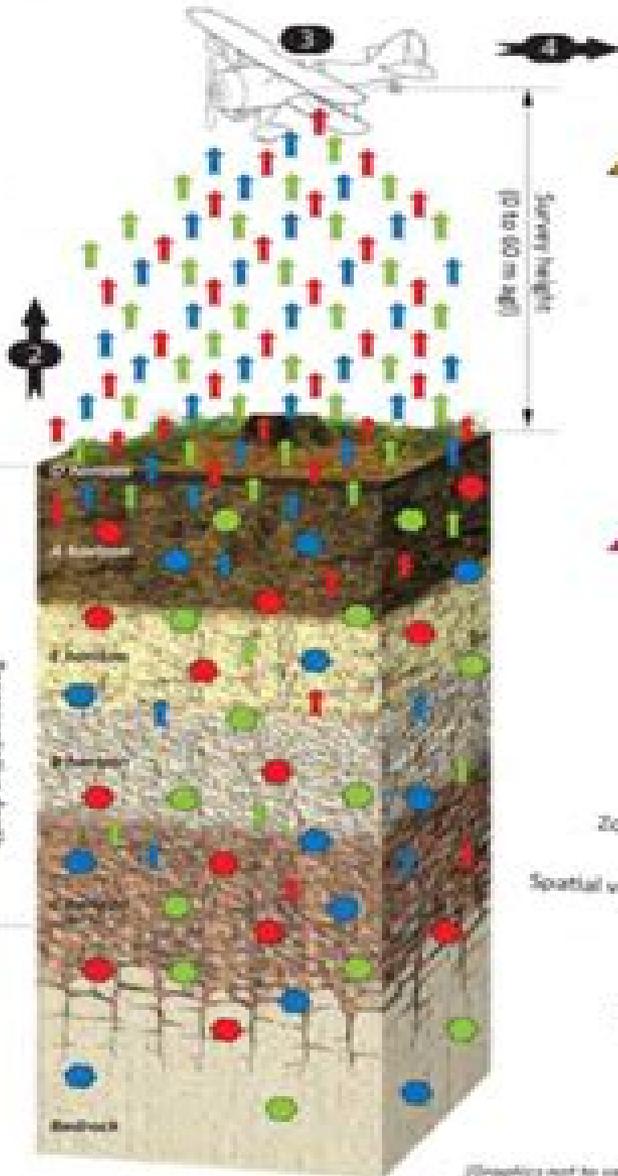

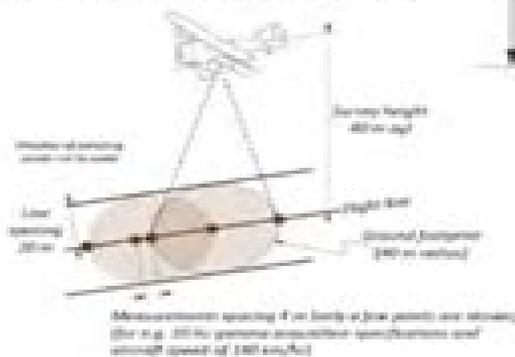

Gamma-ray radiation, which energy is related to the radioactive source elements (K, U, Th) travels through air for up to 300 m agl before to be absorbed by the atmosphere.

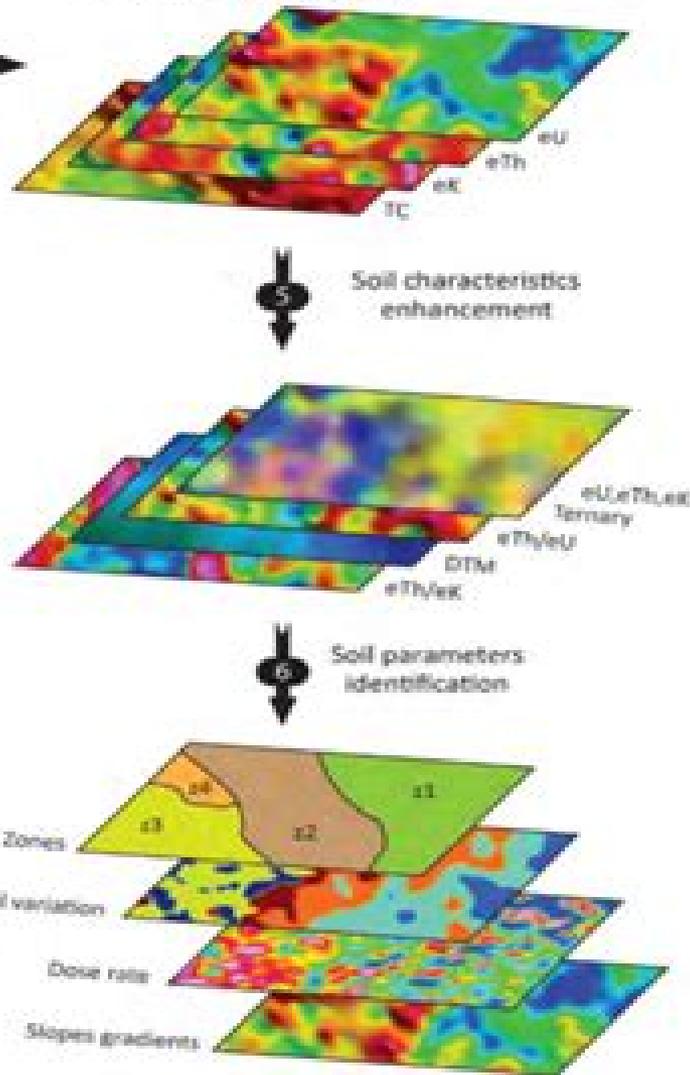

Radioactive source elements naturally occur in the crystals of minerals in soil horizons derived from bedrock:

- Potassium (eq. K)
- Uranium (eq. U)
- Thorium (eq. Th)

(b) Airborne survey specifications

With data processing, recorded gamma-ray spectra (see Diag. 'a') are converted to ground concentrations of K (in %), U and Th (in ppm).

Gamma Ray Spectrometry :

Adopting the Beat of Expression: An Mental Symphony within **Gamma Ray Spectrometry**

In some sort of eaten by displays and the ceaseless chatter of immediate transmission, the melodic beauty and psychological symphony produced by the published word often diminish into the backdrop, eclipsed by the relentless noise and disruptions that permeate our lives. But, situated within the pages of **Gamma Ray Spectrometry** a wonderful literary treasure overflowing with organic feelings, lies an immersive symphony waiting to be embraced. Crafted by an elegant composer of language, this interesting masterpiece conducts readers on a psychological trip, well unraveling the hidden melodies and profound influence resonating within each carefully constructed phrase. Within the depths of the touching examination, we can investigate the book is key harmonies, analyze its enthralling publishing model, and surrender ourselves to the profound resonance that echoes in the depths of readers souls.
