Introduction: These three diagrams are connected, just together in one image.

When the water droplets in the atmosphere condense, they form clouds. They fall back to the Earth in the form of precipitation. This may be rain, depending on the temperature. The water cycle is a continuous process that moves water around the globe and maintains the Earth's temperature by providing for cooling during the summer months.

Water is a vital part of the atmosphere and moves up through evaporation. This helps to keep the planet cool. The water cycle is a continuous process that moves water around the globe and maintains the Earth's temperature by providing for cooling during the summer months.

The Amazing Water Cycle Reading Worksheet

Introduction: Read the passage below about the water cycle. Then answer the multiple-choice questions that follow. Finally, fill in the graphic organizer with information from the passage.

Water is all around us, and it is constantly moving in a process called the water cycle. This cycle has three stages: evaporation, condensation, and precipitation. The sun is the primary energy source for the water cycle. It warms up the water in oceans, lakes, and rivers.

When the sun heats up the water, some of it turns into a gas called water vapor. This process is known as evaporation. The water vapor then rises up into the atmosphere, where it cools and condenses into tiny water droplets. These droplets combine to form clouds. The process is called condensation.

As the water vapor rises higher in the atmosphere, it gets colder. The cold air causes the water vapor to turn back into the water droplets in the clouds. This process is called precipitation.
