Introduction To Cryptography With Maple:

Introduction to Cryptography with Maple, 2012-12-19 **Introduction to Cryptography with Maple** José Luis Gómez Pardo, 2012-12-19 This introduction to cryptography employs a programming oriented approach to study the most important cryptographic schemes in current use and the main cryptanalytic attacks against them Discussion of the theoretical aspects emphasizing precise security definitions based on methodological tools such as complexity and randomness and of the mathematical aspects with emphasis on number theoretic algorithms and their applications to cryptography and cryptanalysis is integrated with the programming approach thus providing implementations of the algorithms and schemes as well as examples of realistic size A distinctive feature of the author's approach is the use of Maple as a programming environment in which not just the cryptographic primitives but also the most important cryptographic schemes are implemented following the recommendations of standards bodies such as NIST with many of the known cryptanalytic attacks implemented as well The purpose of the Maple implementations is to let the reader experiment and learn and for this reason the author includes numerous examples The book discusses important recent subjects such as homomorphic encryption identity based cryptography and elliptic curve cryptography The algorithms and schemes which are treated in detail and implemented in Maple include AES and modes of operation CMAC GCM GMAC SHA 256 HMAC RSA Rabin Elgamal Paillier Cocks IBE DSA and ECDSA In addition some recently introduced schemes enjoying strong security properties such as RSA OAEP Rabin SAEP Cramer Shoup and PSS are also discussed and implemented On the cryptanalysis side Maple implementations and examples are used to discuss many important algorithms including birthday and man in the middle attacks integer factorization algorithms such as Pollard's rho and the quadratic sieve and discrete log algorithms such as baby step giant step Pollard's rho Pohlig Hellman and the index calculus method This textbook is suitable for advanced undergraduate and graduate students of computer science engineering and mathematics satisfying the requirements of various types of courses a basic introductory course a theoretically oriented course whose focus is on the precise definition of security concepts and on cryptographic schemes with reductionist security proofs a practice oriented course requiring little mathematical background and with an emphasis on applications or a mathematically advanced course addressed to students with a stronger mathematical background The main prerequisite is a basic knowledge of linear algebra and elementary calculus and while some knowledge of probability and abstract algebra would be helpful it is not essential because the book includes the necessary background from these subjects and furthermore explores the number theoretic material in detail The book is also a comprehensive reference and is suitable for self study by practitioners and programmers **Introduction to Cryptography with Maple** Thomas Hawk, 2011-04-21 This textbook is suitable for advanced undergraduate and graduate students of computer science engineering and mathematics satisfying the requirements of various types of courses a basic introductory course a theoretically oriented course whose focus is on the precise definition of security concepts and on

cryptographic schemes with reductionist security proofs a practice oriented course requiring little mathematical background and with an emphasis on applications or a mathematically advanced course addressed to students with a stronger mathematical background The main prerequisite is a basic knowledge of linear algebra and elementary calculus and while some knowledge of probability and abstract algebra would be helpful it is not essential because the book includes the necessary background from these subjects and furthermore explores the number theoretic material in detail The book is also a comprehensive reference and is suitable for self study by practitioners and programmers The book discusses important recent subjects such as homomorphic encryption identity based cryptography and elliptic curve cryptography The algorithms and schemes which are treated in detail and implemented in Maple include AES and modes of operation CMAC GCM GMAC SHA 256 HMAC RSA Rabin Elgamal Paillier Cocks IBE DSA and ECDSA In addition some recently introduced schemes enjoying strong security properties such as RSA OAEP Rabin SAEP Cramer Shoup and PSS are also discussed and implemented On the cryptanalysis side Maple implementations and examples are used to discuss many important algorithms including birthday and man in the middle attacks integer factorization algorithms such as Pollard's rho and the quadratic sieve and discrete log algorithms such as baby step giant step Pollard's rho Pohlig Hellman and the index calculus method Discussion of the theoretical aspects emphasizing precise security definitions based on methodological tools such as complexity and randomness and of the mathematical aspects with emphasis on number theoretic algorithms and their applications to cryptography and cryptanalysis is integrated with the programming approach thus providing implementations of the algorithms and schemes as well as examples of realistic size
