Measurement Error and Latent Variables in Econometrics T. Wansbeek, E. Meijer, 2000-12-08 The book first discusses in depth various aspects of the well known inconsistency that arises when explanatory variables in a linear regression model are measured with error Despite this inconsistency the region where the true regression coefficients lie can sometimes be characterized in a useful way especially when bounds are known on the measurement error variance but also when such information is absent Wage discrimination with imperfect productivity measurement is discussed as an important special case Next it is shown that the inconsistency is not accidental but fundamental Due to an identification problem no consistent estimators may exist at all Additional information is desirable This information can be of various types One type is exact prior knowledge about functions of the parameters This leads to the CALS estimator Another major type is in the form of instrumental variables Many aspects of this are discussed including heteroskedasticity combination of data from different sources construction of instruments from the available data and the LIML estimator which is especially relevant when the instruments are weak The scope is then widened to an embedding of the regression equation with measurement error in a multiple equations setting leading to the exploratory factor analysis EFA model This marks the step from measurement error to latent variables Estimation of the EFA model leads to an eigenvalue problem A variety of models is reviewed that involve eigenvalue problems as their common characteristic EFA is extended to confirmatory factor analysis CFA by including restrictions on the parameters of the factor analysis model and next by relating the factors to background variables These models are all structural equation models SEMs a very general and important class of models with the LISREL model as its best known representation encompassing almost all linear equation systems with latent variables Estimation of SEMs can be viewed as an application of the generalized method of moments GMM GMM in general and for SEM in particular is discussed at great length including the generality of GMM optimal weighting conditional moments continuous updating simulation estimation the link with the method of maximum likelihood and in particular testing and model evaluation for GMM The discussion concludes with nonlinear models The emphasis is on polynomial models and models that are nonlinear due to a filter on the dependent variables like discrete choice models or models with ordered categorical variables

Decision Processes by Using Bivariate Normal Quantile Pairs N. C. Das, 2015-10-07 This book discusses equi quantile values and their use in generating decision alternatives under the twofold complexities of uncertainty and dependence offering scope for surrogating between two alternative portfolios when they are correlated The book begins with a discussion on components of rationality and learning models as indispensable concepts in decision making

processes It identifies three fold complexities in such processes uncertainty dependence and dynamism The book is a novel attempt to seek tangible solutions for such decision problems To do so four hundred tables of bi quantile pairs are presented for carefully chosen grids In fact it is a two variable generalization of the inverse normal integral table which is used in obtaining bivariate normal quantile pairs for the given values of probability and correlation When making decisions only two of them have to be taken at a time These tables are essential tools for decision making under risk and dependence and offer scope for delving up to a single step of dynamism The book subsequently addresses averments dealing with applications and advantages The content is useful to empirical scientists and risk oriented decision makers who are often required to make choices on the basis of pairs of variables The book also helps simulators seeking valid confidence intervals for their estimates and particle physicists looking for condensed confidence intervals for Higgs Boson utilizing the Bose Einstein correlation given the magnitude of such correlations Entrepreneurs and investors as well as students of management statistics economics and econometrics psychology psychometrics and psychographics social sciences geographic information system geology agricultural and veterinary sciences medical sciences and diagnostics and remote sensing will also find the book very useful
