

INVESTIGATING THE MAGNITUDE OF MAGNETIC FORCES

Magnets can pull or push on each other without touching. When magnets attract, they pull together. This is called an **attractive magnetic force**. When magnets repel, they push apart. This is called a **repulsive magnetic force**. The diagram shows the magnetic forces between two different pairs of magnets.

The strength of a force is called its **magnitude**. The greater the magnitude of a magnetic force, the stronger the attractive or repulsive force between the magnets. The magnitude of a magnetic force depends on the size of the magnets and the distance between them:

- The larger the size of the magnets, the greater the magnitude of the magnetic force between them.
- The smaller the distance between two magnets, the greater the magnitude of the magnetic force between them.

Look at the pairs of magnets in each problem below. Then answer the questions that follow.

Note: All magnets are made of the same material.

- 1.** Underneath each pair of magnets, write whether they would push away or pull toward each other. Draw a circle around the pair of magnets that shows an attractive magnetic force. Draw a box around the pair of magnets that shows a repulsive magnetic force.

- 2.** Circle the pair of magnets that has the greater magnetic force.

Explain why the pair of magnets you circled above has the greater magnetic force. Is this force attractive or repulsive?

Numerical Solution of Hybrid Nanofluid and Its Stability Over Permeable Wedge Sheet With Heat Transfer Analysis Aisha M. Alqahtani, Zeeshan, Waris Khan, Florentin Smarandache, Nidhal Becheikh, Roobaea Alroobaea, Taseer Muhammad, 2024-01-01 The inclusion of nanoparticles has the potential to improve the thermal efficiency of the base fluid The field of nanofluid NF dynamics has attracted important attention due to its extensive range of practical uses like fuel cells solar energy medication administration heat transfer microfabrication coolant applications and other related domains The aim of this study is to scrutinize the impact of Lorentz force thermal energy joule heating heat source and injection parameters and Brownian and thermoporetic diffusions on the hybrid nanofluid over the moving wedge The stability inquiry is reported for the existing work in order to confirm the stable solutions that make the study unique Novelty of the existing work is to investigate the hybrid nanofluid flow and its stability The nanoparticles MoS₂ and Ag are suspended in ethylene glycol and water used as host fluids The numerical solution is obtained from the dimensionless first order differential equations which are achieved from the basic flow phenomena through similarity alteration variables The influence of emerging factors on flow phenomena is reported via graphs The positive eigenvalues report stable solutions while the negative eigenvalues designate unstable solutions It is perceived that due to Lorentz force the rate of the fluid declines while the temperature inside the flow channel enhances The velocity profile decreases while the temperature and concentration increase with increasing quantities of permeable factors Similarly the Forchheimer number causes to enhance the flow rate and decrease the heat and concentration outlines The current analysis is validated by the published work [Electricity and Magnetism, Grades 6 - 12](#) John B.
