

# FEEDING RELATIONSHIPS

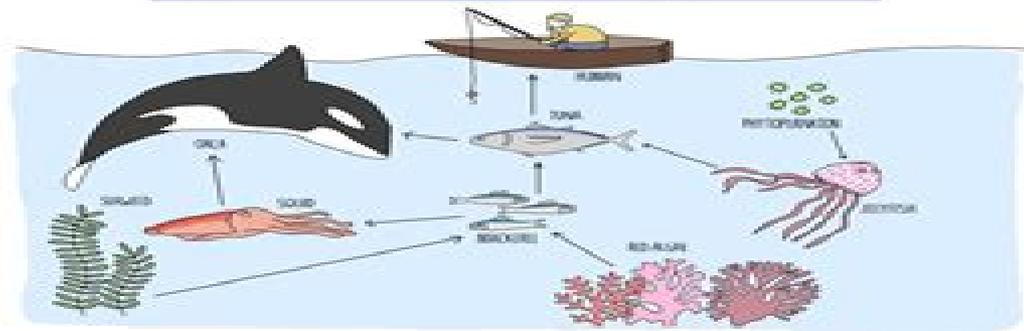

We can use food chains to show the flow of energy from one organism to another. The arrow in a food chain can be thought of as "eaten by". Energy always starts from the Sun and is converted into glucose by photosynthesis in plants. These plants at the beginning of the food chain, which convert light energy into food, are called producers. Producers are eaten by primary consumers, which are eaten by secondary consumers, which in turn are eaten by tertiary consumers.

Herbivore - an organism which only eats plants  
 Carnivore - an organism which only eats animals  
 Omnivore - an organism which eats both plants and animals

Predator - an animal which hunts and kills other animals  
 Prey - an animal which is hunted and eaten by a predator

Food webs show the interaction of multiple interconnected food chains within an ecosystem. For example, in the marine ecosystem pictured below there are a number of food chains which are all connected together. If the population size of any of these organisms changes, it will affect all the other organisms in the food web. This is known as interdependence.

Decomposers also play important roles in food chains by breaking down dead matter. When organisms die, decomposers such as bacteria and fungi secrete digestive enzymes onto the dead material. The enzymes break down the molecules in the organism, converting it into simpler substances which can be absorbed by plants, allowing nutrients to be recycled within an ecosystem.

Pyramids of numbers show the number of organisms (the population size) of each trophic level. The producer is represented at the bottom of the pyramid, with the primary, secondary and tertiary consumers represented on the levels above. Energy is lost at each trophic level of the food chain, which is why the population size usually decreases as you go up the pyramid. These are not always a pyramid shape - for instance if we have a very larger producer such as a tree, then the number of producers (trees) will be much smaller than the primary consumers which feed on it (such as insects).

Pyramids of biomass represent the amount of biomass at each trophic level and will have a regular pyramid shape, since biomass is always lost at each step of the food chain.

Only a proportion (around 10%) is passed onto the next trophic level. Biomass is lost at each stage in the following way:

- Used for respiration to generate energy for processes such as active transport and to maintain body temperature.
- Not all of the organism is eaten (i.e. the bones).
- Not all of the organism is digested - some will be excreted as faeces.

## Questions

Caterpillars feed on leaves and are themselves eaten by lizards. Lizards are eaten by eagles.

1. Draw the food chain for this feeding relationship?
2. Where does the energy in this food chain originate from?
3. Which organism in the food chain is the producer?
4. Which animals in the food chain are herbivores and which are carnivores?
5. What would happen to the populations of other organisms in the ecosystem if the caterpillar population was wiped out by excessive use of pesticides?
