DESCRIPTION

The Central Control Module (CCM) provides the FenwalNET 2000™ with central control capacity. The CCM also provides two independently programmable signal outputs and two independently programmable Form "C" relay contacts along with a general trouble contact which activates upon any system trouble condition. The CCM interfaces to the Fb/Tx module which provides all status information on connected field devices. Upon receipt of a field device status change(s), the CCM will evaluate it's unique Event Output Control (EOC) programming and activate any outputs which are related to the active input(s).

A watchdog timer circuit provides supervision of the microprocessor for proper operation. Should the microprocessor fail, the watchdog circuit would initiate a CPU error which would alert the system operator of the failed condition. Through the use of the unique Fail Soft™ operation, the CCM can still activate outputs in the event of an alarm during the failed condition. This feature ensures maximum system reliability.

System configuration and programming are performed using the FenwalNET Configuration Software (FCS) program. The FCS program is a Windows™ based configuration/programming utility which provides the installer the convenience of completing the configuration off-line and then uploading the system information to the panel to complete the system programming. The FCS program functions allow the installer to tailor the system operation to each particular application.

The system programming is stored in the CCM's nonvolatile memory. Even in the event of total power loss (AC and battery), all the contents of the memory, including time and date settings are retained. Upon restoration of power, the system will operate as previously programmed. All system status changes are logged into and retained by the event history buffer which is capable of maintaining 1000+ events. The history buffer is a nonvolatile memory device which maintains the history information in the event of complete power

loss. Events are time and date stamped for post event analysis. The system menu allows the user to specify either all of the events or a range of events to be displayed or printed.

The CCM contains internal diagnostics which enhance troubleshooting with distinct messages for fault conditions for the CCM inputs/outputs, power supplies, I/O modules and field devices. The distinct messages allow the user to identify the exact system component which is experiencing the fault condition.

The EOC program provides the installer with the ability to relate system inputs to system outputs in a very flexible manner. The program provides logical operators which allow the system to be tailored to meet any Fire Alarm/Fire Suppression application requirement. Once difficult suppression release sequences can be accomplished with minimal effort. The system supports optional release abort input and manual release input functions with ease.

The Real Time Control (RTC) Program provides the installer with the ability to control system functions in relation to time of day, day of week and month of year. System functions which are capable of being controlled are SmartOne™ detection device set point levels and addressable relay output state.

Two RS-232C serial ports are available. One is used for programming and monitoring using the FCS program. A second is used for a remote printer connection. When activated, the serial ports supervise the connection of an active device. Upon disconnection, they will raise a trouble condition on the system. Both RS-232C ports are isolated to protect against ground fault conditions caused by connected equipment.
