The mechanics of respiration involve the contraction and relaxation of the diaphragm and the rib cage. This is dependent on the arrangement of the pleura, the membrane that surrounds the lungs, and the elastic properties of the lung tissue.

Mechanics of Respiration

During normal breathing, the diaphragm contracts and moves down, increasing the volume of the chest cavity.

As the diaphragm contracts, the pressure inside the chest cavity decreases, creating a pressure gradient.

This causes air to flow into the lungs from the atmosphere.

When the diaphragm relaxes and moves up, the volume of the chest cavity decreases.

This causes the pressure inside the chest cavity to increase, forcing air out of the lungs.

The process of air entering the lungs is called inspiration, and the process of air leaving the lungs is called expiration.
