Background

Evolution can be defined as the change in the frequency of one or more alleles in a population's gene pool from one generation to the next, due to natural selection. There are three main types of evolution: **divergent**, **convergent**, and **parallel**.

In convergent evolution, unrelated species become increasingly similar in appearance because of a shared environment. Convergent evolution results in **analogous** structures that carry out a similar function but are not similar in basic structure. This is because they are not inherited from a common ancestor. For example, sharks, porpoises, and penguins are not related through a common ancestor, but they all have peripheral fins and bodies that are similar in shape. These traits are a direct result of adapting to aquatic life. Similarly, wings developed independently in insects, reptiles, birds and bats.

In divergent evolution, two or more species develop from a common ancestor. This happens through adaptation to different environments. Divergent evolution results in **homologous** structures. These are shared by related species because they have been inherited from a common ancestor. For example, the forearms of various vertebrates are homologous because they have similar bone structures but different functions.

Parallel evolution is the development of the same characteristic in unrelated organisms through adaptation to similar environmental conditions. For example, the marsupial mammals of Australia are similar to the placental mammals from other parts of the world. However, marsupials in Australia evolved in isolation after Australia separated from the other continents.

Aim To analyse how different types of evolution give rise to homologous and analogous structures.

Equipment • diagrams and specimens of homologous structures • paper and coloured pencils
• structures and analogous structures

Part A – Homologous structures due to divergent evolution

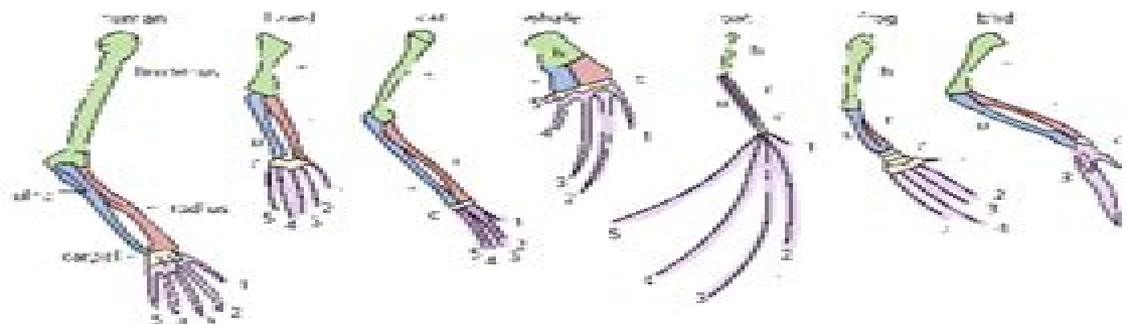

Figure 1: Homologous structures

Method

- 1 Colour the homologous bones in Figure 1. Use green for the humerus, red for the radius, blue for the ulna, yellow for the carpals and metacarpals, purple for the phalanges.
- 2 Compare the bones in the human forearm with the bones in the forearms of the other vertebrates in Figure 2. Note the similarities and differences in bone structure, including the relative size and thickness of the bones. Record your results in Table 1.
