plants that were first grown in the wild before being cultivated for gardens. At some point in history it was discovered that the soil was not necessary for the growing process. Rather, the role of soil is to act as a reservoir to hold the nutrients that a plant needs in order to grow. Crops grown hydroponically according to studies grow faster and healthier and are better than crops grown on soil. This is because they would not have to go through a lot of disadvantages that the soil may present, such as situations of a break out of a soil-borne disease in the area, the struggle to have to push its way through the soil during germination, the attack from organisms and pests that live in the soil. And of course, the plants in hydroponic systems do not have to hustle for nutrients and water because this is basically what they are planted in: in hydroponic systems, water-based mineral nutrient solutions. Hydroponics also helps you save water, which sounds a bit strange when you think of water is essential for this process. Usually, it's every alternate day so that the soil soaks up the water and is transported to the roots. That sounds fine, doesn't it? But that's only a portion of the big picture. Some of the water is bound to seep out of the container, some of it evaporates, and a portion of it seeps further into the soil beyond the plant's roots. So in practice, the plant essentially only uses up a small portion of the water. Hydroponics uses a simple recirculating mechanism that ensures that the water is fully soaked up by the roots. It means that the portion of water that isn't absorbed by the plant is directly sent to the reservoir. The same water from the reservoir is later pumped up to the plants. Since the reservoir is shut tight, there is no chance for the water to evaporate, and it certainly will not seep out of the bottom of the container. You can save around 80% of the water by switching to hydroponics instead of using regular soil gardening. This book covers the following topics: Equipment, Hydroponic Growing System, Plant necessities, Best plant for hydroponics, Pest and disease, Choosing the right site for your garden, Maintenance of your hydroponic garden, and Much More. Do not get scared; hydroponic gardening is not as complicated, tricky, and demanding as your mind is about to convince you that it is. On the contrary, it is very simple. And this is what this book is about: to enlighten you and get you started on having your own hydroponic garden. Ready to get started?

Throughout the last century, scientists and horticulturists experimented with different methods of hydroponics. One of the potential applications of hydroponics that drove research was growing fresh produce in non-arable areas of the world and areas with little to no soil. Hydroponics was used during World War II to supply troops stationed on non-arable islands in the Pacific with fresh produce grown in locally established hydroponic systems. Later in the century, hydroponics was integrated into the space program. As NASA considered the practicalities of locating a society on another planet or the Earth's moon, hydroponics easily fit into their sustainability plans. By the 1970s, it wasn't just scientists and analysts who were involved in hydroponics. Traditional farmers and eager hobbyists began to be attracted to the virtues of hydroponic growing. *Beginner's Guide to Hydroponics* James Sholto Douglas, 1984 *Advanced Guide to Hydroponics* James Sholto Douglas, 1985

So what exactly is hydroponics? And what are the systems that you can choose from? What can you grow from it and how does it work? These next few chapters will outline all that you need to know so that you can create your own system at home and reap the benefits of having a garden without any of the accompanying mess or need for lots of space. Hydroponics Growing System Geoffrey Williams, 2020-04-23. It can be very perplexing to get started in hydroponics. Figuring out the way it all works, how to select a system, what to develop or even HOW to grow are all hard. Here is the common sense. Plants develop via a procedure referred to as photosynthesis in which they use sunlight and a chemical in their leaves referred to as chlorophyll to convert carbon dioxide, a gas in the air, and water into glucose, a type of sugar, and oxygen. Write that out chemically and also you get this equation: $6\text{CO}_2 + 6\text{H}_2\text{O} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$. There's no mention of soil everywhere in there and that's all of the proof you need that vegetation can grow without it. What they do want is water and vitamins, each without problems received from soil. But if they can get this stuff elsewhere, say through standing water with their roots in a nutrient-rich answer, they can do without soil altogether. That's the simple principle in the back of hydroponics. In idea, the word hydroponics means growing flora in water from two Greek phrases meaning water and soil, but because you may grow vegetation without sincerely standing them in water, most of the people define the phrase to intend growing plant life without the use of soil. This manual will come up with the whole thing you need to know about the fundamental varieties of growing structures in hydroponics, which includes the predominant varieties of hydroponic systems, inclusive of their pros and cons.
