Reading: [Genetic Variation in Cornelian Worksho](#) and genetic variation in [genetics](#) (complete each of the following questions, demonstrating your understanding of the concepts discussed in the lecture)

1. Match each of the following changes in DNA sequence structure to its definition:

A. Deletion

B. Duplication

C. Inversion

D. Translocation

(a) a section of a chromosome is inserted

(b) a piece of a chromosome is deleted

(c) a large section of a chromosome has moved (inverted) to a different part of the chromosome

(d) a section of a chromosome appears to be in one place but is in fact in another

2. How many genetically different gametes can be produced from a diploid cell with four chromosomes pairs? Describe your answer.

There are 16 genetically different gametes that can be produced because in 2ⁿ where n is total number chromosomes pairs, a diploid cell with four chromosomes pairs will produce gametes of 2⁴ or 16 genetically different gametes

3. Although your offspring is a combination of both of your genes, you recognize that some traits come from one independent chromosome. For example, both of your eyes are blue, but your nose and hair are inherited together?

That's because linked genes are found on the same chromosome. Traits that are independent assortment are not, and a heterozygous-diploid only passes either one chromosome chromosome from both will be found with some of the alleles in the gametes made. Alleles that are linked together

4. Describe the alignment of chromosomes during prophase I, write the equations:

Homologous chromosomes I chromosomes carry just homologous chromosomes with crossing-over. Each includes 1 to 4 chromosomes because it takes the crossing-over with the same and results in two linked chromosomes

5. How does recombination lead to chromosomes with different alleles? Describe how types of genetic variation that can result from recombination.
