## Section: Cell Membrane

Read the passage below. Then answer the questions that follow.

A cell membrane is made of a double layer of **phospholipid** molecules. Each layer is a mirror image of the other layer. The structure is called a **lipid bilayer**.

Located within the lipid bilayer of the cell membrane are proteins of different types. Each type of membrane protein plays a vital role in the life of a cell. Cell-surface markers are membrane proteins that are attached to a carbohydrate on the cell's surface. Together, the protein and carbohydrate help other cells recognize the cell type—liver cell or heart cell, for example. Receptor proteins are membrane proteins that recognize and bind to specific substances outside the cell. When this happens, the inside of the cell changes, as well. In this way, receptor proteins help cells detect and change in response to things in the environment outside the cell. Enzymes are proteins that change the rate of chemical reactions. Various enzymes in the cell membrane are involved in important biochemical reactions inside the cell. Many substances needed inside the cell cannot pass through the cell membrane on their own. Transport proteins are membrane proteins that aid the movement of these substances through the lipid bilayer of the cell membrane. In this way, transport proteins help carry a variety of substances into and out of the cell.

### SKILL: USING CONTEXT CLUES

Read each question, and write your answer in the space provided.

1. The prefix *bi-* means "two." Why is the term *lipid bilayer* a good name for a cell membrane?
